- Call-by-Value Evaluation
- Call-by-Need Evaluation
- Contextual Equivalence
- Context Lemma
- Turing Completeness

Introduction

Hochschule **RheinMain**

The untyped lambda calculus

- is a foundational model of computation
- is the core of functional programming languages

Lambda notation is used in other settings too:

- non-functional programming languages like Java or Python have introduced functional concepts and lambda expressions
- in mathematics, lambda notation is used to represent function
- we use it later for denotational semantics of an imperative programming language

SYNTAX OF THE LAMBDA CALCULUS

– Syntax of expressions
– Free and bound variables
– Capture-avoiding substitution
– Contexts

Expressions

Expressions

$$\mathbf{Expr} ::= V \mid \lambda V.\mathbf{Expr} \mid (\mathbf{Expr}\ \mathbf{Expr})$$

where V is a non-terminal for variables

Explanations:

$\lambda x.s$	is an abstraction	= an anonymous function, λx binds x in body s
$(s\ t)$	is an application	= expression s is applied to argument t

Examples:

- $\lambda x.x$ is the identity function, like $id(x) = x$, but anonymous
- $((\lambda x.x)\ z)$ represents $id(z)$
- $((\lambda x.x)\ (\lambda x.x))$ represents $id(id)$
- $\lambda x.\lambda y.x$ represents $f(x,y) = x$

Conventions

To omit parentheses, we use the following conventions:

- application is left-associative:

$$s \ t \ r \ \text{means} \ ((s \ t) \ r) \ \text{and not} \ (s \ (t \ r))$$

- the body of an abstraction extends as far as possible:

$$(\lambda x.s \ t \ \text{means} \ \lambda x.(s \ t) \ \text{and not} \ ((\lambda x.s) \ t))$$

- abbreviation:

We write $\lambda x_1, \ldots, x_n.t$ for the nested abstractions $\lambda x_1.(\lambda x_2. \ldots (\lambda x_n.t) \ldots)$.

Examples

Some prominent expressions:

$$
\begin{array}{llll}
I & := \lambda x.x & \text{(identity)} \\
K & := \lambda x.\lambda y.x & \text{(projection to first argument)} \\
K_2 & := \lambda x.\lambda y.y & \text{(projection to second argument)} \\
\Omega & := (\lambda x.(x\ x))\ (\lambda x.(x\ x)) & \text{(diverging expression)} \\
Y & := \lambda f.(\lambda x.(f\ (x\ x)))\ (\lambda x.(f\ (x\ x))) & \text{(call-by-name fixpoint combinator)} \\
Z & := \lambda f.(\lambda x.(f\ \lambda z.(x\ x)\ z))\ (\lambda x.(f\ \lambda z.(x\ x)\ z)) & \text{(call-by-value fixpoint combinator)} \\
S & := \lambda x.\lambda y.\lambda z.(x\ z)\ (y\ z) & \text{(S-combinator)}
\end{array}
$$

Free and Bound Variables

$$
\begin{aligned}
FV(x) \quad &= x & BV(x) \quad &= \emptyset \\
FV(\lambda x.s) &= FV(s) \setminus \{x\} & BV(\lambda x.s) &= BV(s) \cup \{x\} \\
FV(s\ t) \quad &= FV(s) \cup FV(t) & BV(s\ t) \quad &= BV(s) \cup BV(t)
\end{aligned}
$$

Example: $s = (\lambda x.\lambda y.\lambda w.(x\ y\ z))\ x$

Free variables $FV(s) = \{x, z\}$ and $BV(s) = \{x, y, w\}$.

Free and Bound Variables

$$
\begin{aligned}
FV(x) &= x & BV(x) &= \emptyset \\
FV(\lambda x.s) &= FV(s) \setminus \{x\} & BV(\lambda x.s) &= BV(s) \cup \{x\} \\
FV(s\ t) &= FV(s) \cup FV(t) & BV(s\ t) &= BV(s) \cup BV(t)
\end{aligned}
$$

Example: $s = (\lambda x.\lambda y.\lambda w.(x\ y\ z))\ x$

Free variables $FV(s) = \{x, z\}$ and $BV(s) = \{x, y, w\}$.

Closed and open expressions:

- t is closed (or a program) if $FV(t) = \emptyset$
- otherwise t is open

Free and Bound Variables

$$FV(x) \quad = x \qquad\qquad\qquad BV(x) \quad = \emptyset$$
$$FV(\lambda x.s) = FV(s) \setminus \{x\} \qquad BV(\lambda x.s) = BV(s) \cup \{x\}$$
$$FV(s\ t) \quad = FV(s) \cup FV(t) \qquad BV(s\ t) \quad = BV(s) \cup BV(t)$$

Example: $s = (\lambda x.\lambda y.\lambda w.(x\ y\ z))\ x$

Free variables $FV(s) = \{x, z\}$ and $BV(s) = \{x, y, w\}$.

Closed and open expressions:

- t is closed (or a program) if $FV(t) = \emptyset$

- otherwise t is open

Occurrence x in t is bound if it is in scope of a binder λx, otherwise it called free

Example: $\big((\lambda x.\lambda y.\lambda w.(\underbrace{x}_{\text{bound}} \quad \underbrace{y}_{\text{bound}} \quad \underbrace{z}_{\text{free}}))\ \underbrace{x}_{\text{free}}\big)$

Substitution

Definition (Capture-Avoiding Substitution)

If $BV(s) \cap FV(t) = \emptyset$, then $s[t/x]$ is s where all free occurrences of x are replaced by t:

$$
\begin{aligned}
x[t/x] &= t \\
y[t/x] &= y, \text{ if } x \neq y \\
(\lambda y.s)[t/x] &= \begin{cases} \lambda y.(s[t/x]) & \text{if } x \neq y \\ \lambda y.s & \text{if } x = y \end{cases} \\
(s_1\ s_2)[t/x] &= (s_1[t/x]\ s_2[t/x]) \\
(s_1\ s_2)[t/x] &= (s_1[t/x]\ s_2[t/x])
\end{aligned}
$$

Example: $(\lambda x.z\ x)[(\lambda y.y)/z] = (\lambda x.((\lambda y.y)\ x))$.

Without the side condition: $(\lambda x.z\ x)[\lambda y.x/z]$ would lead to $\lambda x.((\lambda y.x)\ x)$

Contexts

Contexts C: Expressions with one hole $[\cdot]$

$$\mathbf{Ctxt} ::= [\cdot] \mid \lambda V.\mathbf{Ctxt} \mid (\mathbf{Ctxt}\ \mathbf{Expr}) \mid (\mathbf{Expr}\ \mathbf{Ctxt})$$

$C[s]$ is an expression: it is C where the hole is replaced by s

This may capture variables, e.g. for context $C = \lambda x.[\cdot]$ and expression $\lambda y.x$:

$$C[\lambda y.x] = \lambda x.(\lambda y.x).$$

α-Renaming and β-Reduction

– Renaming of variables
– Distinct variable convention
– Substitution (with renaming)
– β-reduction, contextual closure

Consistent Renaming of Variables

A single α-renaming-step is of the form:

$$C[\lambda x.s] \xrightarrow{\alpha} C[\lambda y.s[y/x]] \ \text{ if } y \notin BV(C[\lambda x.s]) \cup FV(C[\lambda x.s])$$

The reflexive-transitive closure of $\xrightarrow{\alpha} \cup \xleftarrow{\alpha}$ is called α-equivalence and written $s =_\alpha t$.

We identify α-equivalent expressions (and write $s = t$ also if $s =_\alpha t$)

The Distinct Variable Convention

To avoid naming conflicts, we assume the following convention:

> **Distinct Variable Convention (DVC)**
>
> In any expression s, bound and free variables are disjoint, i.e. $BV(s) \cap FV(s) = \emptyset$, and all variables on binders are pairwise distinct.

The convention can be obeyed by using α-renamings.

Example

$(y \ (\lambda y.((\lambda x.(x \ \lambda x.x)) \ (x \ y)))))$ violates the DVC

Example

$(y \ (\lambda y.((\lambda x.(x \ \lambda x.x)) \ (x \ y)))))$ violates the DVC

since x and y occur free and bound and x occurs twice at a binder

Example

$(y\ (\lambda y.((\lambda x.(x\ \lambda x.x))\ (x\ y))))$ violates the DVC

since x and y occur free and bound and x occurs twice at a binder

apply α-renamings to satisfy the DVC:

$$(y\ (\lambda y.((\lambda x.(x\ \lambda x.x))\ (x\ y))))$$

Example

$(y \ (\lambda y.((\lambda x.(x \ \lambda x.x)) \ (x \ y))))$ violates the DVC

since x and y occur free and bound and x occurs twice at a binder

apply α-renamings to satisfy the DVC:

$$(y \ (\lambda y.((\lambda x.(x \ \lambda x.x)) \ (x \ y))))$$
$$\xrightarrow{\alpha} \ (y \ (\lambda y_1.((\lambda x.(x \ \lambda x.x)) \ (x \ y_1))))$$

Example

$(y \ (\lambda y.((\lambda x.(x \ \lambda x.x)) \ (x \ y)))))$ violates the DVC

since x and y occur free and bound and x occurs twice at a binder

apply α-renamings to satisfy the DVC:

$$(y \ (\lambda y.((\lambda x.(x \ \lambda x.x)) \ (x \ y)))))$$
$$\xrightarrow{\alpha} (y \ (\lambda y_1.((\lambda x.(x \ \lambda x.x)) \ (x \ y_1)))))$$
$$\xrightarrow{\alpha} (y \ (\lambda y_1.((\lambda x_1.(x_1 \ \lambda x.x)) \ (x \ y_1)))))$$

Example

$(y \ (\lambda y.((\lambda x.(x \ \lambda x.x)) \ (x \ y)))) $ violates the DVC

since x and y occur free and bound and x occurs twice at a binder

apply α-renamings to satisfy the DVC:

$$(y \ (\lambda y.((\lambda x.(x \ \lambda x.x)) \ (x \ y))))$$
$$\xrightarrow{\alpha} (y \ (\lambda y_1.((\lambda x.(x \ \lambda x.x)) \ (x \ y_1))))$$
$$\xrightarrow{\alpha} (y \ (\lambda y_1.((\lambda x_1.(x_1 \ \lambda x.x)) \ (x \ y_1))))$$
$$\xrightarrow{\alpha} (y \ (\lambda y_1.((\lambda x_1.(x_1 \ \lambda x_2.x_2)) \ (x \ y_1))))$$

Substitution with Renaming

Substitution $s[t/x]$ without side condition:

> **Definition (Substitution)**
>
> If $BV(s) \cap FV(t) = \emptyset$, then $s[t/x]$ is the capture-avoiding substitution.
>
> Otherwise, let $s' =_\alpha s$ such that s' fulfills the DVC.
>
> Then $BV(s') \cap FV(t) = \emptyset$ holds.
>
> Then let $s[t/x] = s'[t/x]$ using capture-avoiding substitution for $s'[t/x]$.

Note: $s[t/x]$ may not satisfy the DVC.

Better: Used α-renamed copies for each t

β-Reduction

The most important **reduction rule** of the lambda calculus:

Definition

The (direct) (β)-reduction is defined as

$$(\beta) \qquad (\lambda x.s)\ t \xrightarrow{\beta} s[t/x]$$

If $r_1 \xrightarrow{\beta} r_2$, the we say r_1 directly reduces to r_2.

Contextual closure

The contextual closure of β-reduction is $\xrightarrow{C,\beta}$ defined as

$$C[s] \xrightarrow{C,\beta} C[t] \text{ iff } C \text{ is a context and } s \xrightarrow{\beta} t.$$

Hochschule **RheinMain**

$$(\lambda x.x)\ (\lambda y.y)$$

Examples

$$(\lambda x.x)\ (\lambda y.y) \xrightarrow{\beta} x[(\lambda y.y)/x]$$

Examples

$$(\lambda x.x)\ (\lambda y.y) \xrightarrow{\beta} x[(\lambda y.y)/x] = \lambda y.y$$

Examples

$$(\lambda x.x)\ (\lambda y.y) \xrightarrow{\beta} x[(\lambda y.y)/x] = \lambda y.y$$

$$(\lambda y.y\ y\ y)\ (x\ z)$$

Examples

$$(\lambda x.x) \ (\lambda y.y) \xrightarrow{\beta} x[(\lambda y.y)/x] = \lambda y.y$$

$$(\lambda y.y \ y \ y) \ (x \ z) \xrightarrow{\beta} (y \ y \ y)[(x \ z)/y]$$

Examples

$$(\lambda x.x)\ (\lambda y.y) \xrightarrow{\beta} x[(\lambda y.y)/x] = \lambda y.y$$

$$(\lambda y.y\ y\ y)\ (x\ z) \xrightarrow{\beta} (y\ y\ y)[(x\ z)/y] = (x\ z)\ (x\ z)\ (x\ z)$$

Hochschule RheinMain

$$(\lambda x.x)\ (\lambda y.y) \xrightarrow{\beta} x[(\lambda y.y)/x] = \lambda y.y$$

$$(\lambda y.y\ y\ y)\ (x\ z) \xrightarrow{\beta} (y\ y\ y)[(x\ z)/y] = (x\ z)\ (x\ z)\ (x\ z)$$

To obey the DVC after a β-reduction: Apply α-renaming, e.g.

Examples

$$(\lambda x.x)\ (\lambda y.y) \xrightarrow{\beta} x[(\lambda y.y)/x] = \lambda y.y$$

$$(\lambda y.y\ y\ y)\ (x\ z) \xrightarrow{\beta} (y\ y\ y)[(x\ z)/y] = (x\ z)\ (x\ z)\ (x\ z)$$

To obey the DVC after a β-reduction: Apply α-renaming, e.g.

$$(\lambda x.(x\ x))\ (\lambda y.y)$$

$$(\lambda x.x) \ (\lambda y.y) \xrightarrow{\beta} x[(\lambda y.y)/x] = \lambda y.y$$

$$(\lambda y.y \ y \ y) \ (x \ z) \xrightarrow{\beta} (y \ y \ y)[(x \ z)/y] = (x \ z) \ (x \ z) \ (x \ z)$$

To obey the DVC after a β-reduction: Apply α-renaming, e.g.

$$(\lambda x.(x \ x)) \ (\lambda y.y) \xrightarrow{\beta} \underbrace{(\lambda y.y) \ (\lambda y.y)}_{\text{violates the DVC}}$$

Examples

$$(\lambda x.x)\ (\lambda y.y) \xrightarrow{\beta} x[(\lambda y.y)/x] = \lambda y.y$$

$$(\lambda y.y\ y\ y)\ (x\ z) \xrightarrow{\beta} (y\ y\ y)[(x\ z)/y] = (x\ z)\ (x\ z)\ (x\ z)$$

To obey the DVC after a β-reduction: Apply α-renaming, e.g.

$$(\lambda x.(x\ x))\ (\lambda y.y) \xrightarrow{\beta} \underbrace{(\lambda y.y)\ (\lambda y.y)}_{\text{violates the DVC}} =_\alpha \underbrace{(\lambda y_1.y_1)\ (\lambda y_2.y_2)}_{\text{satisfies the DVC}}$$

Reduction Strategy

To evaluate an expression, β-reduction has to be applied to subexpressions, e.g.

$$((\lambda x.x)\ (\lambda y.y))\ (\lambda z.z)$$

Those subexpressions are called a **redex** (reducible expression).

Reduction Strategy

To evaluate an expression, β-reduction has to be applied to subexpressions, e.g.

$$((\lambda x.x)\ (\lambda y.y))\ (\lambda z.z)$$

Those subexpressions are called a **redex** (reducible expression).

Reduction Strategy

To evaluate an expression, β-reduction has to be applied to subexpressions, e.g.

$$((\lambda x.x)\ (\lambda y.y))\ (\lambda z.z) \xrightarrow{C,\beta} (\lambda y.y)\ (\lambda z.z)$$

Those subexpressions are called a **redex** (reducible expression).

Reduction Strategy

To evaluate an expression, β-reduction has to be applied to subexpressions, e.g.

$$((\lambda x.x) \ (\lambda y.y)) \ (\lambda z.z) \xrightarrow{C,\beta} (\lambda y.y) \ (\lambda z.z)$$

Those subexpressions are called a **redex** (reducible expression).

Using $\xrightarrow{C,\beta}$ is not deterministic, e.g. $((\lambda x.x \ x) \ ((\lambda y.y) \ (\lambda z.z)))$ has two redexes:

- $((\lambda x.x \ x) \ ((\lambda y.y) \ (\lambda z.z))) \xrightarrow{C,\beta} ((\lambda y.y) \ (\lambda z.z)) \ ((\lambda y.y) \ (\lambda z.z))$
- $((\lambda x.x \ x) \ ((\lambda y.y) \ (\lambda z.z))) \xrightarrow{C,\beta} ((\lambda x.x \ x) \ (\lambda z.z))$.

Reduction Strategy

To evaluate an expression, β-reduction has to be applied to subexpressions, e.g.

$$((\lambda x.x)\ (\lambda y.y))\ (\lambda z.z) \xrightarrow{C,\beta} (\lambda y.y)\ (\lambda z.z)$$

Those subexpressions are called a **redex** (reducible expression).

Using $\xrightarrow{C,\beta}$ is not deterministic, e.g. $((\lambda x.x\ x)\ ((\lambda y.y)\ (\lambda z.z)))$ has two redexes:

- $((\lambda x.x\ x)\ ((\lambda y.y)\ (\lambda z.z))) \xrightarrow{C,\beta} ((\lambda y.y)\ (\lambda z.z))\ ((\lambda y.y)\ (\lambda z.z))$
- $((\lambda x.x\ x)\ ((\lambda y.y)\ (\lambda z.z))) \xrightarrow{C,\beta} ((\lambda x.x\ x)\ (\lambda z.z))$.

Fixing the position where to apply the reduction is called a **reduction strategy**.

We do it soon, but first we consider arbitrary $\xrightarrow{C,\beta}$-steps.

CHURCH-ROSSER-THEOREM

- The diamond property
- Confluence
- $\to_1$-reduction
- Proof of the Church-Rosser-Theorem

Notation

For a binary relation $\rightarrow \subseteq (M \times M)$, we denote with

- $\leftrightarrow$ the symmetric closure of $\rightarrow$ (i.e. $a \leftrightarrow b$ iff $a \rightarrow b$ or $b \rightarrow a$).

- $\xrightarrow{i}$ the i-fold composition of $\rightarrow$
  ($a \xrightarrow{0} a$ for all $a \in M$ and for $i > 0$: $a \xrightarrow{i} b$, if $\exists b' \in M : a \rightarrow b'$ and $b' \xrightarrow{i-1} b$).

- $\xrightarrow{i \vee j}$ is the union of the i-fold and the j-fold composition
  ($a \xrightarrow{i \vee j} b$ iff $a \xrightarrow{i} b$ or $a \xrightarrow{j} b$).
  In particular, $\xrightarrow{0 \vee 1}$ is the reflexive-closure of $\rightarrow$.

- $\xrightarrow{*}$ the reflexive-transitive closure of $\rightarrow$ ($a \xrightarrow{*} b$ iff $\exists i \in \mathbb{N}_0 : a \xrightarrow{i} b$).

- $\xleftrightarrow{*}$ the reflexive-transitive closure of $\leftrightarrow$.

- $\xrightarrow{+}$ the transitive closure of $\rightarrow$ ($a \xrightarrow{+} b$ iff $\exists i \in \mathbb{N} : a \xrightarrow{i} b$).

# The Diamond Property and Confluence

> **Definition**
>
> A binary relation $\to \subseteq M \times M$
>
> - has the diamond property iff
>   whenever $a \to b$ and $a \to c$ there exists $d \in M$ such that $b \to d$ and $c \to d$.
>
> - is confluent iff $\overset{*}{\to}$ has the diamond property.
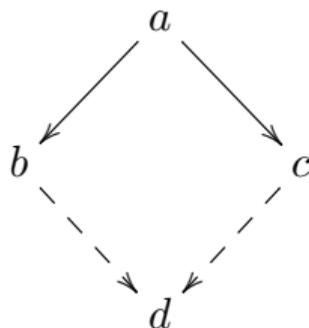

$\to$ has the diamond property $\to$ is confluent

Motivation
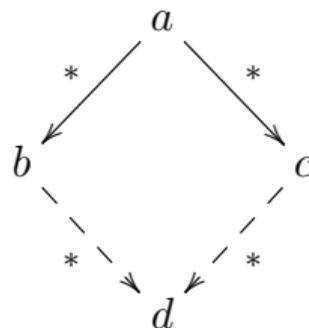

- our goal is to show that $\xrightarrow{C,\beta}$ is confluent
- if confluence holds, then normal forms are unique:
  if we reduce all $\xrightarrow{C,\beta}$-redexes, then we get the same expression (up to α-renaming) independently from the order and positions where the reductions where applied

A Consequence of Confluence

Lemma 3.3.2

If reduction relation $\rightarrow$ is confluent, then $a \overset{*}{\leftrightarrow} b$ implies $\exists c : a \overset{*}{\rightarrow} c \wedge b \overset{*}{\rightarrow} c$
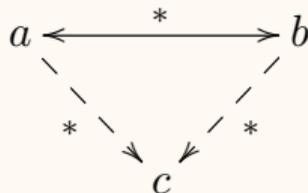

Proof. By induction on $a \overset{i}{\leftrightarrow} b$.

- Base case: if $i = 0$, then $a = b$ and the claim holds
- . . .

Proof (Cont'd)

If $i > 0$, then $\exists a' : a \leftrightarrow a' \overset{i-1}{\longleftrightarrow} b$.

$$a \longleftrightarrow a' \overset{i-1}{\longleftrightarrow} b$$

Proof (Cont'd)

If $i > 0$, then $\exists a' : a \leftrightarrow a' \xleftrightarrow{i-1} b$. By induction hypothesis $\exists c' : a' \xrightarrow{*} c'$ and $b \xrightarrow{*} c'$.

$$a \longleftrightarrow a' \xleftrightarrow{\quad i-1 \quad} b$$
$$* \searrow \quad \swarrow *$$
$$c'$$

Proof (Cont'd)

If $i > 0$, then $\exists a' : a \leftrightarrow a' \xleftrightarrow{i-1} b$. By induction hypothesis $\exists c' : a' \xrightarrow{*} c'$ and $b \xrightarrow{*} c'$.
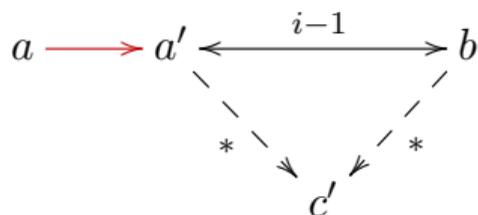

$$a \longrightarrow a' \xleftrightarrow{\quad i-1 \quad} b$$
$$a' \xrightarrow{*} c' \xleftarrow{*} b$$
$$c'$$

- If $a \rightarrow a'$, then $a \rightarrow a' \xrightarrow{*} c'$ and thus $a \xrightarrow{*} c'$. Since also $b \xrightarrow{*} c'$, the claim holds.

Proof (Cont'd)

If $i > 0$, then $\exists a' : a \leftrightarrow a' \xleftrightarrow{i-1} b$. By induction hypothesis $\exists c' : a' \xrightarrow{*} c'$ and $b \xrightarrow{*} c'$.

- If $a \to a'$, then $a \to a' \xrightarrow{*} c'$ and thus $a \xrightarrow{*} c'$. Since also $b \xrightarrow{*} c'$, the claim holds.
- If $a' \to a$, then $a' \xrightarrow{*} a$.

$\square$

Proof (Cont'd)

If $i > 0$, then $\exists a' : a \leftrightarrow a' \xleftrightarrow{i-1} b$. By induction hypothesis $\exists c' : a' \xrightarrow{*} c'$ and $b \xrightarrow{*} c'$.
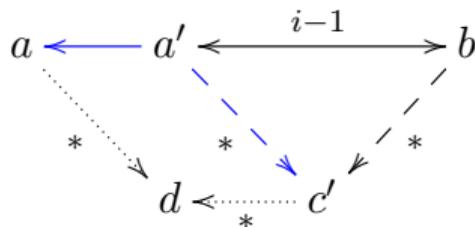

- If $a \to a'$, then $a \to a' \xrightarrow{*} c'$ and thus $a \xrightarrow{*} c'$. Since also $b \xrightarrow{*} c'$, the claim holds.
- If $a' \to a$, then $a' \xrightarrow{*} a$.
  Since $\to$ is confluent, $\xrightarrow{*}$ has the diamond property and thus:
 from $a' \xrightarrow{*} a$ and $a' \xrightarrow{*} c'$, we obtain d with $a \xrightarrow{*} d$ and $c' \xrightarrow{*} d$.

Proof (Cont'd)

If $i > 0$, then $\exists a' : a \leftrightarrow a' \xleftrightarrow{i-1} b$. By induction hypothesis $\exists c' : a' \xrightarrow{*} c'$ and $b \xrightarrow{*} c'$.
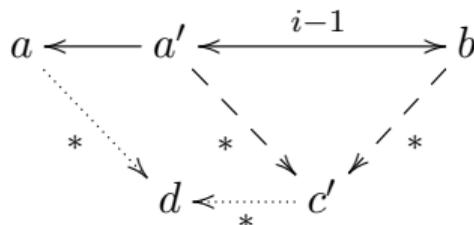

- If $a \to a'$, then $a \to a' \xrightarrow{*} c'$ and thus $a \xrightarrow{*} c'$. Since also $b \xrightarrow{*} c'$, the claim holds.
- If $a' \to a$, then $a' \xrightarrow{*} a$.
  Since $\to$ is confluent, $\xrightarrow{*}$ has the diamond property and thus:
  from $a' \xrightarrow{*} a$ and $a' \xrightarrow{*} c'$, we obtain d with $a \xrightarrow{*} d$ and $c' \xrightarrow{*} d$.
  Since $b \xrightarrow{*} c' \xrightarrow{*} d$, the claim holds. $\qquad\square$

Diamond Property: Inheritance from $\to$ to $\overset{*}{\to}$

Lemma 3.3.3

Let $\to$ be a binary relation and $\overset{*}{\to}$ be its reflexive-transitive closure.
If $\to$ has the diamond property, then $\overset{*}{\to}$ has the diamond property.

Proof: By induction on (i, j) one can show that:

If $a \overset{i}{\to} b$ and $a \overset{j}{\to} c$ then $\exists d$: $b \overset{i}{\to} d$ and $c \overset{j}{\to} d$.

The inner square diagrams follow from the diamond property of $\to$.
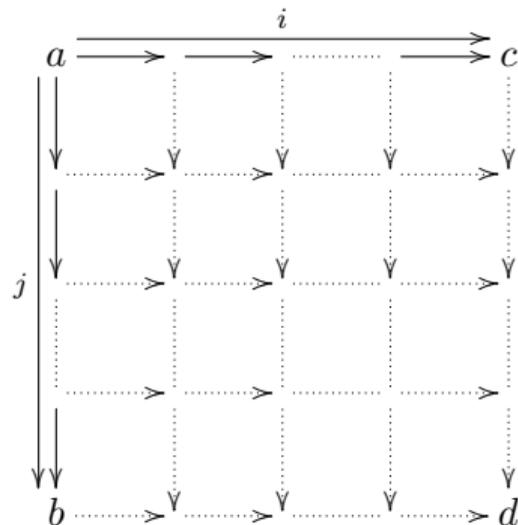

Closures of $\xrightarrow{\beta}$

- With $s \xleftrightarrow{C,\beta} t$ we denote the symmetric closure of $\xrightarrow{C,\beta}$
  (i.e. $s \xleftrightarrow{C,\beta} t$ iff $s \xrightarrow{C,\beta} t$ or $t \xrightarrow{C,\beta} s$)

- With $s \xrightarrow{C,\beta,*} t$ we denote the reflexive-transitive closure of $\xrightarrow{C,\beta}$

- With $s \xleftrightarrow{C,\beta,*} t$ we denote the reflexive-transitive closure of $\xleftrightarrow{C,\beta}$

The relation $\xleftrightarrow{C,\beta,*}$ is sometimes also called β-equivalence or also convertibility.

➡ Idea:

- Another reduction relation $\rightarrow_1$ with $\xrightarrow{C,\beta,0\vee1}\ \subseteq\ \rightarrow_1\ \subseteq\ \xrightarrow{C,\beta,*}$ and $\xrightarrow{*}_1 = \xrightarrow{C,\beta,*}$

- Prove diamond-property of $\rightarrow_1$. This implies diamond-property of $\xrightarrow{*}_1 = \xrightarrow{C,\beta,*}$

$\rightarrow_1$-Reduction

Definition (Parallel Reduction $\rightarrow_1$)

The relation $\rightarrow_1 \subseteq (\mathbf{Expr} \times \mathbf{Expr})$ is inductively defined by:

1. $s \rightarrow_1 s$ for all expressions s.

2. if $s_1 \rightarrow_1 s_2$ and $t_1 \rightarrow_1 t_2$, then $(s_1 \ s_2) \rightarrow_1 (t_1 \ t_2)$.

3. if $s_1 \rightarrow_1 s_2$ and $t_1 \rightarrow_1 t_2$, then $((\lambda x.s_1) \ t_1) \rightarrow_1 s_2[t_2/x]$.

4. if $s \rightarrow_1 t$, then $\lambda x.s \rightarrow_1 \lambda x.t$.

Lemma 3.3.7

$$\xrightarrow{C,\beta} \subseteq \to_1$$

Proof. Let $C[(\lambda x.s)\ t] \xrightarrow{C,\beta} C[s[t/x]]$. We show $C[(\lambda x.s)\ t] \to_1 C[s[t/x]]$ by structural induction on C.

If $C = [\cdot]$, then $(\lambda x.s)\ t \to_1 s[t/x]$ by ❸, since $s \to_1 s$ and $t \to_1 t$ by ❶.

If $C \neq [\cdot]$ we use as IH that $C'[(\lambda x.s)\ t] \to_1 C'[s[t/x]]$ where C' is a proper subcontext of context C.

- If $C = (C'\ r)$, then $r \to_1 r$ by ❶, $C'[(\lambda x.s)\ t] \to_1 C'[s[t/x]]$ by the IH and thus $C[(\lambda x.s)\ t] = (C'[(\lambda x.s)\ t]\ r) \to_1 (C'[s[t/x]]\ r) = C[s[t/x]]$ by ❷.

- The case $C = (r\ C')$ is completely analogous to the previous one.

- If $C = \lambda y.C'$, then $C'[(\lambda x.s)\ t] \to_1 C'[s[t/x]]$ by the IH and thus $C[(\lambda x.s)\ t] = \lambda y.C'[(\lambda x.s)\ t] \to_1 \lambda y.C'[s[t/x]] = C[s[t/x]]$ by ❹. □

Lemma 3.3.10

If $s \rightarrow_1 r$ and $t \rightarrow_1 u$ then $s[t/x] \rightarrow_1 r[u/x]$.

Proof. This can be shown by induction on $s \rightarrow_1 r$.

The base case $s = r$ can be shown by structural induction on s.

For the induction step, we only show one exemplary case:

- If $s = (s_1 \ s_2) \rightarrow_1 (r_1 \ r_2) = r$ with $s_i \rightarrow_1 r_i$ for $i = 1, 2$, the IH shows
  $s_i[t/x] \rightarrow_1 r_i[u/x]$ for $i = 1, 2$ and thus $(s_1[t/x] \ s_2[t/x]) \rightarrow_1 (r_1[u/x] \ r_2[u/x])$.
  Since $s[t/x] = (s_1 \ s_2)[t/x]$ and $(r_1 \ r_2)[u/x] = r[u/x]$, the claim holds.

Diamond Property for $\rightarrow_1$

Lemma 3.3.11
Relation $\rightarrow_1$ has the diamond property.

Proof. We show that whenever $s \rightarrow_1 t$ then for all r with $s \rightarrow_1 r$ there exists r' with $t \rightarrow_1 r'$ and $r \rightarrow r'$.

We use induction on the definition of $\rightarrow_1$ in $s \rightarrow_1 t$.

Base case: $t = s$, i.e. $s \rightarrow_1 s$. Then choose $r' = r$ and the claim holds.

For the induction step, all other cases of the definition of $\rightarrow_1$ have to be considered. We show one exemplary case.

If $s = ((\lambda x.s_1)\ s_2)$ and $t = t_1[t_2/x]$ where $s_i \to_1 t_i$, then for $s \to_1 r$ there are two cases:

- $s = ((\lambda x.s_1)\ s_2) \to_1 ((\lambda x.r_1)\ r_2)$ with $s_1 \to_1 r_1$ and $s_2 \to_1 r_2$.
  Applying the IH to $s_1 \to_1 t_1$ and $s_1 \to_1 r_1$ and also to $s_2 \to_1 t_2$ and $s_2 \to_1 r_2$
  shows that there exists r_1' and r_2' such that: $t_i \to_1 r_i'$, $r_i \to_1 r_i'$ for $i = 1, 2$.
  This shows that $t_1[t_2/x] \to_1 r_1'[r_2'/x]$ and $((\lambda x.r_1)\ r_2) \to_1 r_1'[r_2'/x]$ (using the
  previous lemma). Thus the diamond property holds.

- If $s = ((\lambda x.s_1)\ s_2)$ and $r = r_1[r_2/x]$ where $s_1 \to_1 r_1$ and $s_2 \to_1 r_2$. Applying the
  IH to $s_1 \to_1 t_1$ and $s_1 \to_1 r_1$ and also to $s_2 \to_1 t_2$ and $s_2 \to_1 r_2$ shows that there
  exists r_1' and r_2' such that: $t_i \to_1 r_i'$, $r_i \to_1 r_i'$ for $i = 1, 2$. This shows that
  $t_1[t_2/x] \to_1 r_1'[r_2'/x]$ and $r_1[r_2/x] \to_1 r_1'[r_2'/x]$ (using the previous lemma). Thus
  the diamond property holds.

Lemma 3.3.12

$\xrightarrow{C,\beta,*} = \xrightarrow{*}_1$

Proof (Sketch).
Since $\xrightarrow{C,\beta} \subseteq \to_1$ (Lemma 3.3.7), $\xrightarrow{C,\beta,*} \subseteq \xrightarrow{*}_1$ also holds.

$\to_1 \subseteq \xrightarrow{\beta,*}$ can be proved by inspecting the different cases of the inductive definition of $\to_1$.

Finally, $\xrightarrow{*}_1 \subseteq \xrightarrow{C,\beta}$ holds, since $\xrightarrow{*}_1 \subseteq \left(\xrightarrow{C,\beta,*} \right)^*$ and $\xrightarrow{C,\beta,*}{}^* = \xrightarrow{C,\beta,*}$.

Church-Rosser-Theorem

> **Church-Rosser-Theorem**
>
> For the lambda calculus the following holds: If $a \xleftrightarrow{C,\beta,*} b$, then there exists c, such that $a \xrightarrow{C,\beta,*} c$ and $b \xrightarrow{C,\beta,*} c$
>
> $$a \xleftrightarrow{C,\beta,*} b$$
> $$a \xrightarrow{C,\beta,*} c \qquad b \xrightarrow{C,\beta,*} c$$
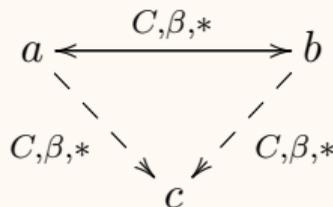

Proof.

Applying Lemma 3.3.3 for $\rightarrow_1$ (using Lemma 3.3.11) shows that $\rightarrow_1$ is confluent and that $\xrightarrow{*}_1$ has the diamond property.

With the equation of Lemma 3.3.12, we have that $\xrightarrow{C,\beta,*}$ has the diamond property and thus $\xrightarrow{C,\beta}$ is confluent. Finally, Lemma 3.3.2 then shows the claim. □

CALL-BY-NAME EVALUATION

– Reduction contexts
– Alternative definition with labeling
– Convergence
– Standardisation-Theorem

Call-by-Name Evaluation

Ideas:

- do not reduce below λ
- reduce the leftmost-outermost β-redex
- in $(\lambda x.s)\ t$ pass t to the function body without evaluating t

---

Definition

Reduction contexts R are built by the following grammar:

$$\mathbf{RCtxt} ::= [\cdot] \mid (\mathbf{RCtxt}\ \mathbf{Expr})$$

If $r_1 \xrightarrow{\beta} r_2$ and R is a reduction context,
then $R[r_1] \xrightarrow{name} R[r_2]$ is a call-by-name reduction step.

Example

$$(\lambda w.w)\ \big((\lambda u.u)\ (\lambda v.v)\big)\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)$$

$$\xrightarrow{name}\ (\lambda u.u)\ (\lambda v'.v')\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)$$

$$\xrightarrow{name}\ (\lambda v.v)\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)$$

$$\xrightarrow{name}\ \lambda x.((\lambda y.y)\ (\lambda z.z))$$

$$\xrightarrow{name}\!\!\!\!/$$

Alternative Definition of Call-by-Name Reduction

Use a labeling algorithm to mark the redex:

- For expression s, start with $s^\star$.
- Apply the label shifting as long as possible:

$$(s_1 \ s_2)^\star \Rightarrow (s_1^\star \ s_2)$$

The result is of the form $(s_1^\star \ s_2 \ \ldots \ s_n)$, where s_1 is not an application.

- If s_1 is an abstraction $\lambda x.s_1'$ and $n \geq 2$, then reduce as follows:

$$(\lambda x.s_1') \ s_2 \ \ldots s_n \xrightarrow{name} (s_1'[s_2/x] \ \ldots s_n)$$

- If s_1 is an abstraction and $n = 1$, then no call-by-name reduction is applicable
  (since the whole expression is an abstraction)
- If s_1 is a variable, then no call-by-name reduction is applicable
  (since a free variable has been detected)

Example

$$\Big(\big((\lambda w.w)\ ((\lambda u.u)\ (\lambda v.v))\big)\ (\lambda x.((\lambda y.y)\ (\lambda z.z)))\Big)$$

Example

$$\Big(\big((\lambda w.w)\ ((\lambda u.u)\ (\lambda v.v))\big)\ (\lambda x.((\lambda y.y)\ (\lambda z.z)))\Big)^{\star}$$

Example

$$\left(\left(\big((\lambda w.w) \ ((\lambda u.u) \ (\lambda v.v)) \big) \right)^{\star} \ (\lambda x.((\lambda y.y) \ (\lambda z.z))) \right)$$

Hochschule **RheinMain**

$$\Big(\big((\lambda w.w)^\star \ ((\lambda u.u) \ (\lambda v.v))\big) \ \big(\lambda x.((\lambda y.y) \ (\lambda z.z)))\big)\Big)$$

Example

$$\xrightarrow{name} \begin{array}{l} \Big(\big((\lambda w.w)\ ((\lambda u.u)\ (\lambda v.v))\big)\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z)))\big) \\ \Big(((\lambda u.u)\ (\lambda v.v))\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z)))\Big) \end{array}$$

Example

$$\xrightarrow{name} \begin{array}{l} \Big(\big((\lambda w.w)\ ((\lambda u.u)\ (\lambda v.v))\big)\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)\Big) \\ \Big(((\lambda u.u)\ (\lambda v.v))\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)\Big)^{\star} \end{array}$$

$$\xrightarrow{name} \begin{array}{l} \Big(\big((\lambda w.w)\ ((\lambda u.u)\ (\lambda v.v))\big)\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z)))\Big) \\ \Big(((\lambda u.u)\ (\lambda v.v))^{\star}\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z)))\Big) \end{array}$$

$$\xrightarrow{name} \begin{array}{l} \Big(\big((\lambda w.w)\ ((\lambda u.u)\ (\lambda v.v))\big)\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)\Big) \\ \Big(((\lambda u.u)^\star\ (\lambda v.v))\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)\Big) \end{array}$$

Example

$$\left(\left(\left(\lambda w.w\right)\ \left((\lambda u.u)\ (\lambda v.v)\right)\right)\ \left(\lambda x.((\lambda y.y)\ (\lambda z.z))\right)\right)$$
$$\xrightarrow{name}\ \left(\left((\lambda u.u)\ (\lambda v.v)\right)\ \left(\lambda x.((\lambda y.y)\ (\lambda z.z))\right)\right)$$
$$\xrightarrow{name}\ \left((\lambda v.v)\ \left(\lambda x.((\lambda y.y)\ (\lambda z.z))\right)\right)$$

Example

$$\xrightarrow{name} \Big(\Big((\lambda w.w)\ \big((\lambda u.u)\ (\lambda v.v)\big)\Big)\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)\Big)$$

$$\xrightarrow{name} \Big(\big((\lambda u.u)\ (\lambda v.v)\big)\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)\Big)$$

$$\xrightarrow{name} \Big((\lambda v.v)\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)\Big)^{\star}$$

Example

$$\xrightarrow{name} \left(\left((\lambda w.w)\ ((\lambda u.u)\ (\lambda v.v))\right)\ \left(\lambda x.((\lambda y.y)\ (\lambda z.z))\right)\right)$$

$$\xrightarrow{name} \left(((\lambda u.u)\ (\lambda v.v))\ \left(\lambda x.((\lambda y.y)\ (\lambda z.z))\right)\right)$$

$$\xrightarrow{name} \left((\lambda v.v)^{\star}\ \left(\lambda x.((\lambda y.y)\ (\lambda z.z))\right)\right)$$

$$\Big(\big((\lambda w.w)\ ((\lambda u.u)\ (\lambda v.v))\big)\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)\Big)$$

$$\xrightarrow{name}\ \Big(\big((\lambda u.u)\ (\lambda v.v)\big)\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)\Big)$$

$$\xrightarrow{name}\ \Big((\lambda v.v)\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)\Big)$$

$$\xrightarrow{name}\ \big(\lambda x.((\lambda y.y)\ (\lambda z.z))\big)$$

Example

$$
\begin{aligned}
&\quad \Big(\big((\lambda w.w)\ ((\lambda u.u)\ (\lambda v.v)) \big)\ (\lambda x.((\lambda y.y)\ (\lambda z.z))) \Big) \\
&\xrightarrow{name} \Big(((\lambda u.u)\ (\lambda v.v))\ (\lambda x.((\lambda y.y)\ (\lambda z.z))) \Big) \\
&\xrightarrow{name} \Big((\lambda v.v)\ (\lambda x.((\lambda y.y)\ (\lambda z.z))) \Big) \\
&\xrightarrow{name} \big(\lambda x.((\lambda y.y)\ (\lambda z.z)) \big)^{\star}
\end{aligned}
$$

Convergence

- Call-by-name reduction is deterministic: if $s \xrightarrow{name} t$ and $s \xrightarrow{name} t' \implies t = t'$
- No call-by-name reducion is applicable iff $s = R[x]$ or if s is an abstraction (called an FWHNF (functional weak head normal form))
- Reaching an FWHNF means success
- $\xrightarrow{name,+}$ and $\xrightarrow{name,*}$ are the transitive and reflexive-transitive closure of $\xrightarrow{name}$.

Definition

Expression s (call-by-name) converges $s{\downarrow}$ iff $\exists$abstraction $v : s \xrightarrow{name,*} v$.

If s does not converge, we write $s{\Uparrow}$ and say s diverges.

Standardisation (Preparations)

- Goal: show that call-by-name evaluation is optimal w.r.t. convergence
- Technique: $\rightarrow_1$-reduction, also on contexts:
  C is treated like an expression with constant $[\cdot]$
- If $R \rightarrow_1 R'$ for a reduction context R, then R' is also a reduction context.
- If $C \rightarrow_1 C'$, $s \rightarrow_1 s'$, where C is a context, then $C[s] \rightarrow_1 C[s']$

Definition ($\xrightarrow{name}_1$ and $\xrightarrow{int}_1$)

If $R \rightarrow_1 R'$, $s \rightarrow_1 s'$, $t \rightarrow_1 t'$, and R is a reduction context, then

$$R[(\lambda x.s)\ t] \xrightarrow{name}_1 R'[s'[t'/x]]$$

Let $\xrightarrow{int}_1 := \rightarrow_1 \setminus \xrightarrow{name}_1$ be the internal $\xrightarrow{1}$-reduction.

Note that: $\xrightarrow{name} \subset \xrightarrow{name}_1 \subset \rightarrow_1$

Standardisation (Preparations, cont'd)

Counting the contracted redexes:

Definition

Define the measure $\phi : \to_1 \to \mathbb{N}_0$ inductively as

$$\phi(x \to_1 x) = 0, \text{ if } x \text{ is a variable}$$
$$\phi(\lambda x.s \to_1 \lambda x.s') = \phi(s \to s')$$
$$\phi(((\lambda x.s)\ t) \to_1 s'[t'/x]) = 1 + \phi(s \to_1 s') + k \cdot \phi(t \to_1 t'), \text{ where } k \text{ is the number of}$$
$$\text{free occurrences of } x \text{ in } s$$
$$\phi((s\ t) \to_1 (s'\ t')) = \phi(s \to_1 s') + \phi(t \to_1 t')$$

Measure ϕ is defined for every $\to_1$-step and it is well-founded.

Splitting $\rightarrow_1$

Hochschule RheinMain

> **Lemma 3.4.10**
>
> If $s \rightarrow_1 t$, then $s \xrightarrow{name,*} s' \xrightarrow{int}_1 t$.

Proof. If $s \xrightarrow{int}_1 t$, then the claim holds.

Otherwise, $s \xrightarrow{name}_1 t$, i.e. $s = R[(\lambda x.r)\ u]$, $r \rightarrow_1 r'$, $u \rightarrow_1 u'$, $R \rightarrow_1 R'$, $t = R'[r'[u'/x]]$.
Then $s \xrightarrow{name} R[r[u/x]] \rightarrow_1 R'[r'[u'/x]]$ and this can be iterated. If the iteration stops, the demanded reduction sequence is constructed.

For termination, we verify $\phi(s \rightarrow_1 t) > \phi(R[r[u/x]] \rightarrow_1 R'[r'[u'/x]])$:

$$\phi(R[(\lambda x.r)\ u] \rightarrow_1 R'[r'[u'/x]]) = \phi(R \rightarrow_1 R') + \phi((\lambda x.r)\ u \rightarrow_1 r'[u'/x])$$
$$= \phi(R \rightarrow_1 R') + 1 + \phi(r \rightarrow_1 r') + k\phi(u \rightarrow_1 u')$$
$$\phi(R[r[u/x]]] \rightarrow_1 R'[r'[u'/x]]) = \phi(R \rightarrow_1 R') + \phi(r \rightarrow_1 r') + k\phi(u \rightarrow_1 u')$$

where k is the number of free occurrences of x in r. $\qquad\square$

Shifting $\xrightarrow{name}$ over $\rightarrow_1$

Lemma 3.4.11

Let $s \rightarrow_1 t \xrightarrow{name} r$, then there exists u
such that $s \xrightarrow{name,+} u \xrightarrow{int}_1 r$.

Proof.

By Lemma 3.4.10 $s \rightarrow_1 t \xrightarrow{name} r$ can be written as $s \xrightarrow{name,*} t' \xrightarrow{int}_1 t \xrightarrow{name} r$.

Since $t \xrightarrow{name} r$, we can assume that $t = R[(\lambda x.t_0)\ t_1] \xrightarrow{name} R[t_0[t_1/x]] = r$.

Since $t' \xrightarrow{int}_1 t$ is internal, $t' = R'[(\lambda x.t'_0)\ t'_1]$ where $R' \rightarrow_1 R$, $t'_0 \rightarrow_1 t_0$, and $t'_1 \rightarrow_1 t_1$.

Then $t' = R'[(\lambda x.t'_0)\ t'_1] \xrightarrow{name} R'[t'_0[t'_1/x]] \xrightarrow{int}_1 R[t_0[t_1/x]] = r$ holds. $\square$

Shifting $\xrightarrow{name,*}$ over $\rightarrow_1$

Applying Lemma 3.4.11 iteratively shows:

Lemma 3.4.12

If $s \rightarrow_1 t \xrightarrow{name,*} v$, v is an FWHNF, then $s \xrightarrow{name,*} v' \xrightarrow{int}_1 v$ where v' is an FWHNF.

The induction is on the number of $\xrightarrow{name}$-steps.

For the base case, observe that $\xrightarrow{int}_1$ steps do not transform non-FWHNFs into FWHNFs.

For the induction step, apply Lemma 3.4.11 and use the induction hypothesis.

Standardisation-Theorem

Call-by-name evaluation is an optimal strategy w.r.t. termination:

Standardisation-Theorem

If $s \xrightarrow{C,\beta,*} v$ where v is a FWHNF, then $s\!\downarrow$.

Proof. The given sequence is also a sequence of $\rightarrow_1$-reductions, since $\xrightarrow{C,\beta} \subseteq \rightarrow_1$.
We show by induction on n: if $s \xrightarrow{n}_1 v$ where v is an FWHNF, then $s\!\downarrow$.
If $n = 0$, then the claim holds. The induction step:

$$
\begin{array}{ccccc}
s & \xrightarrow{} & s' & \xrightarrow{\quad n-1 \quad} & v \\
 & {\scriptstyle 1} & {\scriptstyle |} & {\scriptstyle 1} & \\
{\scriptstyle name,*} & & {\scriptstyle | \; name,*} & & \\
 & & \downarrow & & \\
v'' & \xdashrightarrow[{\scriptstyle 1}]{\; int \;} & v' & &
\end{array}
$$

Dashed steps follow from the IH, dotted steps follow by Lemma 3.4.12

CALL-BY-VALUE EVALUATION

Call-by-Value Evaluation

- Used in strict functional programming languages like ML, F#, . . .
- Difference to call-by-name: β-reduction is only permitted if the argument is a value (an abstraction)

Definition

The (direct) (β_{value})-reduction is defined as

$$(\lambda x.s) \; v \xrightarrow{\beta_{value}} s[v/x] \text{ where } v \text{ is a variable or an abstraction.}$$

We write $\xrightarrow{C,\beta_{value}}$ for the contextual closure of $\xrightarrow{\beta_{value}}$.

Call-by-Value Evaluation (Cont'd)

Hochschule **RheinMain**

Call-by-value evaluation requires to evaluate parameters before calling the function!

Definition

Call-by-value reduction contexts E are built as follows:

$$\mathbf{ECtxt} ::= [\cdot] \mid (\mathbf{ECtxt}\ \mathbf{Expr}) \mid ((\lambda V.\mathbf{Expr})\ \mathbf{ECtxt})$$

If $r_1 \xrightarrow{\beta_{value}} r_2$ and E is a call-by-value reduction context, then

$$E[r_1] \xrightarrow{value} E[r_2]$$

is a call-by-value reduction.

Example

$$(\lambda x.(x\ (x\ x)))\ ((\lambda y.y\ y)\ (\lambda z.z))$$

Example

$$(\lambda x.(x\ (x\ x)))\ ((\lambda y.y\ y)\ (\lambda z.z))$$

Example

$$(\lambda x.(x\ (x\ x)))\ ((\lambda y.y\ y)\ (\lambda z.z))$$

$$\xrightarrow{value}\ (\lambda x.(x\ (x\ x)))\ ((\lambda z_1.z_1)(\lambda z_2.z_2))$$

Example

$$(\lambda x.(x \ (x \ x))) \ ((\lambda y.y \ y) \ (\lambda z.z))$$

$$\xrightarrow{value} \ (\lambda x.(x \ (x \ x))) \ ((\lambda z_1.z_1)(\lambda z_2.z_2))$$

Example

$$(\lambda x.(x\ (x\ x)))\ ((\lambda y.y\ y)\ (\lambda z.z))$$

$$\xrightarrow{value}\ (\lambda x.(x\ (x\ x)))\ ((\lambda z_1.z_1)(\lambda z_2.z_2))$$

$$\xrightarrow{value}\ (\lambda x.(x\ (x\ x)))\ (\lambda z_2.z_2)$$

Example

$$(\lambda x.(x\ (x\ x)))\ ((\lambda y.y\ y)\ (\lambda z.z))$$

$$\xrightarrow{value} \quad (\lambda x.(x\ (x\ x)))\ ((\lambda z_1.z_1)(\lambda z_2.z_2))$$

$$\xrightarrow{value} \quad (\lambda x.(x\ (x\ x)))\ (\lambda z_2.z_2)$$

Example

$$(\lambda x.(x\ (x\ x)))\ ((\lambda y.y\ y)\ (\lambda z.z))$$

$$\xrightarrow{value}\ (\lambda x.(x\ (x\ x)))\ ((\lambda z_1.z_1)(\lambda z_2.z_2))$$

$$\xrightarrow{value}\ (\lambda x.(x\ (x\ x)))\ (\lambda z_2.z_2)$$

$$\xrightarrow{value}\ (\lambda z_2.z_2)\ ((\lambda z_3.z_3)\ (\lambda z_4.z_4))$$

$$(\lambda x.(x\ (x\ x)))\ ((\lambda y.y\ y)\ (\lambda z.z))$$

$$\xrightarrow{value}\ (\lambda x.(x\ (x\ x)))\ ((\lambda z_1.z_1)(\lambda z_2.z_2))$$

$$\xrightarrow{value}\ (\lambda x.(x\ (x\ x)))\ (\lambda z_2.z_2)$$

$$\xrightarrow{value}\ (\lambda z_2.z_2)\ ((\lambda z_3.z_3)\ (\lambda z_4.z_4))$$

Example

$$(\lambda x.(x \ (x \ x))) \ ((\lambda y.y \ y) \ (\lambda z.z))$$

$$\xrightarrow{value} \ (\lambda x.(x \ (x \ x))) \ ((\lambda z_1.z_1)(\lambda z_2.z_2))$$

$$\xrightarrow{value} \ (\lambda x.(x \ (x \ x))) \ (\lambda z_2.z_2)$$

$$\xrightarrow{value} \ (\lambda z_2.z_2) \ ((\lambda z_3.z_3) \ (\lambda z_4.z_4))$$

$$\xrightarrow{value} \ (\lambda z_2.z_2) \ (\lambda z_4.z_4)$$

Example

$$(\lambda x.(x\ (x\ x)))\ ((\lambda y.y\ y)\ (\lambda z.z))$$

$$\xrightarrow{value}\ (\lambda x.(x\ (x\ x)))\ ((\lambda z_1.z_1)(\lambda z_2.z_2))$$

$$\xrightarrow{value}\ (\lambda x.(x\ (x\ x)))\ (\lambda z_2.z_2)$$

$$\xrightarrow{value}\ (\lambda z_2.z_2)\ ((\lambda z_3.z_3)\ (\lambda z_4.z_4))$$

$$\xrightarrow{value}\ (\lambda z_2.z_2)\ (\lambda z_4.z_4)$$

$$(\lambda x.(x \ (x \ x))) \ ((\lambda y.y \ y) \ (\lambda z.z))$$

$$\xrightarrow{value} \ (\lambda x.(x \ (x \ x))) \ ((\lambda z_1.z_1)(\lambda z_2.z_2))$$

$$\xrightarrow{value} \ (\lambda x.(x \ (x \ x))) \ (\lambda z_2.z_2)$$

$$\xrightarrow{value} \ (\lambda z_2.z_2) \ ((\lambda z_3.z_3) \ (\lambda z_4.z_4))$$

$$\xrightarrow{value} \ (\lambda z_2.z_2) \ (\lambda z_4.z_4)$$

$$\xrightarrow{value} \ (\lambda z_4.z_4)$$

Alternative Definition with Labels

- For s, start with $s^\star$.
- Exhaustively apply the rules:

  $(s_1\ s_2)^\star \Rightarrow (s_1^\star\ s_2)$
  $(v^\star\ s) \Rightarrow (v\ s^\star)$ if v is an abstraction and s is not an abstraction or a variable

Three cases

- s is labeled with $\star$ and s is an abstraction: no reduction applicable
- $s = E[x^\star]$, i.e. a free variable in reduction position: no reduction applicable
- $s = E[(\lambda x.t)^\star\ v]$ where v is an abstraction or variable:
  Then $E[(\lambda x.t)\ v] \xrightarrow{\ value\ } E[t[v/x]]$

Example

$$\big((\lambda x.(x\ (x\ x)))\ ((\lambda y.y\ y)\ (\lambda z.z))\big)$$

Example

$$\left((\lambda x.(x\ (x\ x)))\ ((\lambda y.y\ y)\ (\lambda z.z))\right)^{\star}$$

Example

$$\big((\lambda x.(x\ (x\ x)))^{\star}\ ((\lambda y.y\ y)\ (\lambda z.z))\big)$$

Example

$$((\lambda x.(x\ (x\ x)))\ ((\lambda y.y\ y)\ (\lambda z.z))^{\star})$$

Example

$$\big((\lambda x.(x\ (x\ x)))\ ((\lambda y.y\ y)^{\star}\ (\lambda z.z))\big)$$

Example

$$((\lambda x.(x\ (x\ x)))\ ((\lambda y.y\ y)\ (\lambda z.z)))$$

$$\xrightarrow{value}\ ((\lambda x.(x\ (x\ x)))\ ((\lambda z_1.z_1)\ (\lambda z_2.z_2)))$$

$$\xrightarrow{value}\ (\lambda x_5.x_5)^{\textcolor{red}{\star}}$$

Convergence

Note that call-by-value reduction is deterministic.

Definition

Expression s converges for call-by-value evaluation:

$$s\downarrow_{value} \text{ iff } \exists \text{abstraction } v : s \xrightarrow{value,*} v.$$

If $\neg s\downarrow_{value}$, then we write $s\Uparrow_{value}$ (s diverges for call-by-value evaluation).

Call-by-Name vs. Call-by-Value

Standardisation-Theorem immediately shows:

Corollary

For all expressions s: $s\!\downarrow_{value}\implies s\!\downarrow$

Call-by-Name vs. Call-by-Value

Standardisation-Theorem immediately shows:

> **Corollary**
>
> For all expressions s: $s\downarrow_{value} \implies s\downarrow$

The converse does **not** hold:

- $\Omega := (\lambda x.x\ x)\ (\lambda x.x\ x)$.
- $\Omega \xrightarrow{name} \Omega$ and also $\Omega \xrightarrow{value} \Omega$
- $(\lambda x.\lambda y.y)\ \Omega \xrightarrow{name} \lambda y.y$, thus $(\lambda x.\lambda y.y)\ \Omega\downarrow$
- $(\lambda x.\lambda y.y)\ \Omega \xrightarrow{value} (\lambda x.\lambda y.y)\ \Omega$, thus $(\lambda x.\lambda y.y)\ \Omega\Uparrow_{value}$

Call-by-Name vs. Call-by-Value (Cont'd)

Consider $f\ s_1\ s_2\ s_3$

- In call-by-value evaluation: first s_1, then s_2, then s_3, then the application
  $\longrightarrow$ Evaluation order is predictable

- In call-by-name evaluation: first the application.
  When (if it all) s_1, s_2, s_3 are evaluated depends on the definition of f!
  $\longrightarrow$ Evaluation order is not predictable

- This is relevant, if $s_i = \mathtt{print}\ i$

- Main reason why strict functional languages (ML, Ocaml,...) permit direct side-effects, but non-strict functional languages (Haskell) forbid them.

CALL-BY-NEED EVALUATION

Call-by-Need Evaluation

- Also called: lazy evaluation with sharing
- It optimizes the call-by-name evaluation: by avoiding duplicated evaluations:

  - Consider $(\lambda x. \ldots \ x \ \ldots \ x) \ t$.
  - In call-by-name evaluation t is copied and perhaps evaluated several times!
  - Idea of call-by-need: share the result of evaluating t
  - We use a new construct for this sharing $\mathtt{let} \ x = t \ \mathtt{in} \ \ldots$

Expressions with `let`

$$\mathbf{Expr} ::= V \mid \lambda V.\mathbf{Expr} \mid (\mathbf{Expr} \ \mathbf{Expr}) \mid \mathtt{let} \ V = \mathbf{Expr} \ \mathtt{in} \ \mathbf{Expr}$$

Note that `let` in Haskell is recursive, here we have a non-recursive `let`.

Call-by-Need Lambda Calculus: Evaluation

Reduction contexts are $\mathbf{R}_{need}$:

$$\mathbf{R}_{need} \quad ::= \quad \mathbf{LR}[\mathbf{A}] \mid \mathbf{LR}[\texttt{let } x = \mathbf{A} \texttt{ in } \mathbf{R}_{need}[x]]$$

$$\mathbf{A} \quad ::= \quad [\cdot] \mid (\mathbf{A} \ \mathbf{Expr})$$

$$\mathbf{LR} \quad ::= \quad [\cdot] \mid \texttt{let } V = \mathbf{Expr} \texttt{ in } \mathbf{LR}$$

- $\mathbf{A} \; \widehat{=}$ left into the application
- $\mathbf{LR} \; \widehat{=}$ right into the let

Call-by-Need Lambda Calculus: Evaluation (Cont'd)

Call-by-need reduction step $\xrightarrow{need}$, defined by:

$(lbeta)$ $R_{need}[(\lambda x.s)\ t] \xrightarrow{need} R_{need}[\texttt{let}\ x = t\ \texttt{in}\ s]$

(cp) $\quad LR[\texttt{let}\ x = \lambda y.s\ \texttt{in}\ R_{need}[x]] \xrightarrow{need} LR[\texttt{let}\ x = \lambda y.s\ \texttt{in}\ R_{need}[\lambda y.s]]$

$(llet)$ $\quad LR[\texttt{let}\ x = (\texttt{let}\ y = s\ \texttt{in}\ t)\ \texttt{in}\ R_{need}[x]]$
$\qquad \xrightarrow{need} LR[\texttt{let}\ y = s\ \texttt{in}\ (\texttt{let}\ x = t\ \texttt{in}\ R_{need}[x])]$

$(lapp)$ $R_{need}[(\texttt{let}\ x = s\ \texttt{in}\ t)\ r] \xrightarrow{need} R_{need}[\texttt{let}\ x = s\ \texttt{in}\ (t\ r)]$

- $(lbeta)$ and (cp) replace (β),
- $(lapp)$ and $(llet)$ adjust lets

Labeling-Algorithm

- Labels: $\star, \diamond, \odot$
- $\star \vee \diamond$ means $\star$ or $\diamond$
- For s, start with $s^\star$.

Shifting-Rules:

$$
\begin{array}{lll}
(1) & (\texttt{let } x = s \texttt{ in } t)^\star & \Rightarrow & (\texttt{let } x = s \texttt{ in } t^\star) \\
(2) & (\texttt{let } x = C_1[y^\diamond] \texttt{ in } C_2[x^\odot]) & \Rightarrow & (\texttt{let } x = C_1[y^\diamond] \texttt{ in } C_2[x]) \\
(3) & (\texttt{let } x = s \texttt{ in } C[x^{\star \vee \diamond}]) & \Rightarrow & (\texttt{let } x = s^\diamond \texttt{ in } C[x^\odot]) \\
(4) & (s\ t)^{\star \vee \diamond} & \Rightarrow & (s^\diamond\ t)
\end{array}
$$

where (2) is preferred over (3)

Hochschule RheinMain

$(lbeta)$ $((\lambda x.s)^\diamond\ t) \to \mathtt{let}\ x = t\ \mathtt{in}\ s$

(cp) $\mathtt{let}\ x = (\lambda y.s)^\diamond\ \mathtt{in}\ C[x^\circledcirc] \to \mathtt{let}\ x = \lambda y.s\ \mathtt{in}\ C[\lambda y.s]$

$(llet)$ $\mathtt{let}\ x = (\mathtt{let}\ y = s\ \mathtt{in}\ t)^\diamond\ \mathtt{in}\ C[x^\circledcirc]$
$\to \mathtt{let}\ y = s\ \mathtt{in}\ (\mathtt{let}\ x = t\ \mathtt{in}\ C[x])]$

$(lapp)$ $((\mathtt{let}\ x = s\ \mathtt{in}\ t)^\diamond\ r) \to \mathtt{let}\ x = s\ \mathtt{in}\ (t\ r)$

Example

$$(\mathtt{let}\ x = (\lambda u.u)\ (\lambda w.w)\ \mathtt{in}\ ((\lambda y.y)^{\diamondsuit}\ x))$$

$$\xrightarrow{need, lbeta}\ (\mathtt{let}\ x = ((\lambda u.u)^{\diamondsuit}\ (\lambda w.w))\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y))$$

$$\xrightarrow{need, lbeta}\ (\mathtt{let}\ x = (\mathtt{let}\ u = \lambda w.w\ \mathtt{in}\ u)^{\diamondsuit}\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y))$$

$$\xrightarrow{need, llet}\ (\mathtt{let}\ u = \lambda w.w\ \mathtt{in}\ (\mathtt{let}\ x = u\ \mathtt{in}\ (\mathtt{let}\ y = x^{\diamondsuit}\ \mathtt{in}\ y^{\circledcirc})))$$

Example

$$(\text{let } x = (\lambda u.u) \ (\lambda w.w) \text{ in } ((\lambda y.y)^{\diamond} \ x))$$

$$\xrightarrow{need,lbeta} (\text{let } x = ((\lambda u.u)^{\diamond} \ (\lambda w.w)) \text{ in } (\text{let } y = x^{\circledcirc} \text{ in } y))$$

$$\xrightarrow{need,lbeta} (\text{let } x = (\text{let } u = \lambda w.w \text{ in } u)^{\diamond} \text{ in } (\text{let } y = x^{\circledcirc} \text{ in } y))$$

$$\xrightarrow{need,llet} (\text{let } u = \lambda w.w \text{ in } (\text{let } x = u \text{ in } (\text{let } y = x^{\diamond} \text{ in } y)))$$

Example

$$(\mathtt{let}\ x = (\lambda u.u)\ (\lambda w.w)\ \mathtt{in}\ ((\lambda y.y)^{\diamond}\ x))$$

$\xrightarrow{need,lbeta} (\mathtt{let}\ x = ((\lambda u.u)^{\diamond}\ (\lambda w.w))\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y))$

$\xrightarrow{need,lbeta} (\mathtt{let}\ x = (\mathtt{let}\ u = \lambda w.w\ \mathtt{in}\ u)^{\diamond}\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y))$

$\xrightarrow{need,llet} (\mathtt{let}\ u = \lambda w.w\ \mathtt{in}\ (\mathtt{let}\ x = u^{\diamond}\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y)))$

Example

$$(\mathtt{let}\ x = (\lambda u.u)\ (\lambda w.w)\ \mathtt{in}\ ((\lambda y.y)^{\diamond}\ x))$$

$\xrightarrow{need,lbeta}\ (\mathtt{let}\ x = ((\lambda u.u)^{\diamond}\ (\lambda w.w))\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y))$

$\xrightarrow{need,lbeta}\ (\mathtt{let}\ x = (\mathtt{let}\ u = \lambda w.w\ \mathtt{in}\ u)^{\diamond}\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y))$

$\xrightarrow{need,llet}\ (\mathtt{let}\ u = \lambda w.w\ \mathtt{in}\ (\mathtt{let}\ x = u^{\diamond}\ \mathtt{in}\ (\mathtt{let}\ y = x\ \mathtt{in}\ y)))$

Example

$$(\texttt{let } x = (\lambda u.u) \ (\lambda w.w) \text{ in } ((\lambda y.y)^{\diamond} \ x))$$

$$\xrightarrow{need, lbeta} (\texttt{let } x = ((\lambda u.u)^{\diamond} \ (\lambda w.w)) \text{ in } (\texttt{let } y = x^{\circledcirc} \text{ in } y))$$

$$\xrightarrow{need, lbeta} (\texttt{let } x = (\texttt{let } u = \lambda w.w \text{ in } u)^{\diamond} \text{ in } (\texttt{let } y = x^{\circledcirc} \text{ in } y))$$

$$\xrightarrow{need, llet} (\texttt{let } u = (\lambda w.w)^{\diamond} \text{ in } (\texttt{let } x = u^{\circledcirc} \text{ in } (\texttt{let } y = x \text{ in } y)))$$

Example

$$(\texttt{let } x = (\lambda u.u) \; (\lambda w.w) \texttt{ in } ((\lambda y.y)^{\diamond} \; x))$$

$\xrightarrow{need, lbeta} (\texttt{let } x = ((\lambda u.u)^{\diamond} \; (\lambda w.w)) \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y))$

$\xrightarrow{need, lbeta} (\texttt{let } x = (\texttt{let } u = \lambda w.w \texttt{ in } u)^{\diamond} \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y))$

$\xrightarrow{need, llet} (\texttt{let } u = (\lambda w.w)^{\diamond} \texttt{ in } (\texttt{let } x = u^{\circledcirc} \texttt{ in } (\texttt{let } y = x \texttt{ in } y)))$

$\xrightarrow{need, cp} (\texttt{let } u = (\lambda w.w) \texttt{ in } (\texttt{let } x = (\lambda w.w) \texttt{ in } (\texttt{let } y = x \texttt{ in } y)))^{\star}$

Example

$$(\mathtt{let}\ x = (\lambda u.u)\ (\lambda w.w)\ \mathtt{in}\ ((\lambda y.y)^{\diamond}\ x))$$

$\xrightarrow{need,lbeta} (\mathtt{let}\ x = ((\lambda u.u)^{\diamond}\ (\lambda w.w))\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y))$

$\xrightarrow{need,lbeta} (\mathtt{let}\ x = (\mathtt{let}\ u = \lambda w.w\ \mathtt{in}\ u)^{\diamond}\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y))$

$\xrightarrow{need,llet} (\mathtt{let}\ u = (\lambda w.w)^{\diamond}\ \mathtt{in}\ (\mathtt{let}\ x = u^{\circledcirc}\ \mathtt{in}\ (\mathtt{let}\ y = x\ \mathtt{in}\ y)))$

$\xrightarrow{need,cp} (\mathtt{let}\ u = (\lambda w.w)\ \mathtt{in}\ (\mathtt{let}\ x = (\lambda w.w)\ \mathtt{in}\ (\mathtt{let}\ y = x\ \mathtt{in}\ y))^{\star})$

Example

$$(\texttt{let } x = (\lambda u.u) \; (\lambda w.w) \texttt{ in } ((\lambda y.y)^{\diamond} \; x))$$

$\xrightarrow{need,lbeta}$ $(\texttt{let } x = ((\lambda u.u)^{\diamond} \; (\lambda w.w)) \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y))$

$\xrightarrow{need,lbeta}$ $(\texttt{let } x = (\texttt{let } u = \lambda w.w \texttt{ in } u)^{\diamond} \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y))$

$\xrightarrow{need,llet}$ $(\texttt{let } u = (\lambda w.w)^{\diamond} \texttt{ in } (\texttt{let } x = u^{\circledcirc} \texttt{ in } (\texttt{let } y = x \texttt{ in } y)))$

$\xrightarrow{need,cp}$ $(\texttt{let } u = (\lambda w.w) \texttt{ in } (\texttt{let } x = (\lambda w.w) \texttt{ in } (\texttt{let } y = x \texttt{ in } y)^{\star}))$

Example

$$(\texttt{let } x = (\lambda u.u) \ (\lambda w.w) \text{ in } ((\lambda y.y)^{\diamond} \ x))$$

$\xrightarrow{need,lbeta} (\texttt{let } x = ((\lambda u.u)^{\diamond} \ (\lambda w.w)) \text{ in } (\texttt{let } y = x^{\circledcirc} \text{ in } y))$

$\xrightarrow{need,lbeta} (\texttt{let } x = (\texttt{let } u = \lambda w.w \text{ in } u)^{\diamond} \text{ in } (\texttt{let } y = x^{\circledcirc} \text{ in } y))$

$\xrightarrow{need,llet} (\texttt{let } u = (\lambda w.w)^{\diamond} \text{ in } (\texttt{let } x = u^{\circledcirc} \text{ in } (\texttt{let } y = x \text{ in } y)))$

$\xrightarrow{need,cp} (\texttt{let } u = (\lambda w.w) \text{ in } (\texttt{let } x = (\lambda w.w) \text{ in } (\texttt{let } y = x \text{ in } y^{\star})))$

Example

$$(\mathtt{let}\ x = (\lambda u.u)\ (\lambda w.w)\ \mathtt{in}\ ((\lambda y.y)^{\diamond}\ x))$$

$\xrightarrow{need,lbeta}$ $(\mathtt{let}\ x = ((\lambda u.u)^{\diamond}\ (\lambda w.w))\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y))$

$\xrightarrow{need,lbeta}$ $(\mathtt{let}\ x = (\mathtt{let}\ u = \lambda w.w\ \mathtt{in}\ u)^{\diamond}\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y))$

$\xrightarrow{need,llet}$ $(\mathtt{let}\ u = (\lambda w.w)^{\diamond}\ \mathtt{in}\ (\mathtt{let}\ x = u^{\circledcirc}\ \mathtt{in}\ (\mathtt{let}\ y = x\ \mathtt{in}\ y)))$

$\xrightarrow{need,cp}$ $(\mathtt{let}\ u = (\lambda w.w)\ \mathtt{in}\ (\mathtt{let}\ x = (\lambda w.w)\ \mathtt{in}\ (\mathtt{let}\ y = x^{\diamond}\ \mathtt{in}\ y^{\circledcirc})))$

Example

$$(\texttt{let}\ x = (\lambda u.u)\ (\lambda w.w)\ \texttt{in}\ ((\lambda y.y)^{\diamond}\ x))$$

$$\xrightarrow{need,lbeta}\ (\texttt{let}\ x = ((\lambda u.u)^{\diamond}\ (\lambda w.w))\ \texttt{in}\ (\texttt{let}\ y = x^{\circledcirc}\ \texttt{in}\ y))$$

$$\xrightarrow{need,lbeta}\ (\texttt{let}\ x = (\texttt{let}\ u = \lambda w.w\ \texttt{in}\ u)^{\diamond}\ \texttt{in}\ (\texttt{let}\ y = x^{\circledcirc}\ \texttt{in}\ y))$$

$$\xrightarrow{need,llet}\ (\texttt{let}\ u = (\lambda w.w)^{\diamond}\ \texttt{in}\ (\texttt{let}\ x = u^{\circledcirc}\ \texttt{in}\ (\texttt{let}\ y = x\ \texttt{in}\ y)))$$

$$\xrightarrow{need,cp}\ (\texttt{let}\ u = (\lambda w.w)\ \texttt{in}\ (\texttt{let}\ x = (\lambda w.w)\ \texttt{in}\ (\texttt{let}\ y = x^{\diamond}\ \texttt{in}\ y)))$$

Example

$$(\mathtt{let}\ x = (\lambda u.u)\ (\lambda w.w)\ \mathtt{in}\ ((\lambda y.y)^{\diamond}\ x))$$

$\xrightarrow{need,lbeta} (\mathtt{let}\ x = ((\lambda u.u)^{\diamond}\ (\lambda w.w))\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y))$

$\xrightarrow{need,lbeta} (\mathtt{let}\ x = (\mathtt{let}\ u = \lambda w.w\ \mathtt{in}\ u)^{\diamond}\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y))$

$\xrightarrow{need,llet} (\mathtt{let}\ u = (\lambda w.w)^{\diamond}\ \mathtt{in}\ (\mathtt{let}\ x = u^{\circledcirc}\ \mathtt{in}\ (\mathtt{let}\ y = x\ \mathtt{in}\ y)))$

$\xrightarrow{need,cp} (\mathtt{let}\ u = (\lambda w.w)\ \mathtt{in}\ (\mathtt{let}\ x = (\lambda w.w)^{\diamond}\ \mathtt{in}\ (\mathtt{let}\ y = x^{\circledcirc}\ \mathtt{in}\ y)))$

Example

$$(\texttt{let } x = (\lambda u.u) \ (\lambda w.w) \texttt{ in } ((\lambda y.y)^{\diamond} \ x))$$

$\xrightarrow{\textit{need,lbeta}} (\texttt{let } x = ((\lambda u.u)^{\diamond} \ (\lambda w.w)) \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y))$

$\xrightarrow{\textit{need,lbeta}} (\texttt{let } x = (\texttt{let } u = \lambda w.w \texttt{ in } u)^{\diamond} \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y))$

$\xrightarrow{\textit{need,llet}} (\texttt{let } u = (\lambda w.w)^{\diamond} \texttt{ in } (\texttt{let } x = u^{\circledcirc} \texttt{ in } (\texttt{let } y = x \texttt{ in } y)))$

$\xrightarrow{\textit{need,cp}} (\texttt{let } u = (\lambda w.w) \texttt{ in } (\texttt{let } x = (\lambda w.w)^{\diamond} \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y)))$

$\xrightarrow{\textit{need,cp}} (\texttt{let } u = (\lambda w.w) \texttt{ in } (\texttt{let } x = (\lambda w.w) \texttt{ in } (\texttt{let } y = (\lambda w.w) \texttt{ in } y)))^{\star}$

Example

$$(\texttt{let } x = (\lambda u.u) \ (\lambda w.w) \texttt{ in } ((\lambda y.y)^{\diamond} \ x))$$

$\xrightarrow{need,lbeta} (\texttt{let } x = ((\lambda u.u)^{\diamond} \ (\lambda w.w)) \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y))$

$\xrightarrow{need,lbeta} (\texttt{let } x = (\texttt{let } u = \lambda w.w \texttt{ in } u)^{\diamond} \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y))$

$\xrightarrow{need,llet} (\texttt{let } u = (\lambda w.w)^{\diamond} \texttt{ in } (\texttt{let } x = u^{\circledcirc} \texttt{ in } (\texttt{let } y = x \texttt{ in } y)))$

$\xrightarrow{need,cp} (\texttt{let } u = (\lambda w.w) \texttt{ in } (\texttt{let } x = (\lambda w.w)^{\diamond} \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y)))$

$\xrightarrow{need,cp} (\texttt{let } u = (\lambda w.w) \texttt{ in } (\texttt{let } x = (\lambda w.w) \texttt{ in } (\texttt{let } y = (\lambda w.w) \texttt{ in } y))^{\star})$

Example

$$(\texttt{let } x = (\lambda u.u) \ (\lambda w.w) \text{ in } ((\lambda y.y)^{\diamond} \ x))$$

$\xrightarrow{need,lbeta}$ $(\texttt{let } x = ((\lambda u.u)^{\diamond} \ (\lambda w.w)) \text{ in } (\texttt{let } y = x^{\circledcirc} \text{ in } y))$

$\xrightarrow{need,lbeta}$ $(\texttt{let } x = (\texttt{let } u = \lambda w.w \text{ in } u)^{\diamond} \text{ in } (\texttt{let } y = x^{\circledcirc} \text{ in } y))$

$\xrightarrow{need,llet}$ $(\texttt{let } u = (\lambda w.w)^{\diamond} \text{ in } (\texttt{let } x = u^{\circledcirc} \text{ in } (\texttt{let } y = x \text{ in } y)))$

$\xrightarrow{need,cp}$ $(\texttt{let } u = (\lambda w.w) \text{ in } (\texttt{let } x = (\lambda w.w)^{\diamond} \text{ in } (\texttt{let } y = x^{\circledcirc} \text{ in } y)))$

$\xrightarrow{need,cp}$ $(\texttt{let } u = (\lambda w.w) \text{ in } (\texttt{let } x = (\lambda w.w) \text{ in } (\texttt{let } y = (\lambda w.w) \text{ in } y)^{\star}))$

Example

$$(\texttt{let } x = (\lambda u.u) \ (\lambda w.w) \texttt{ in } ((\lambda y.y)^{\diamond} \ x))$$

$\xrightarrow{need,lbeta}$ $(\texttt{let } x = ((\lambda u.u)^{\diamond} \ (\lambda w.w)) \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y))$

$\xrightarrow{need,lbeta}$ $(\texttt{let } x = (\texttt{let } u = \lambda w.w \texttt{ in } u)^{\diamond} \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y))$

$\xrightarrow{need,llet}$ $(\texttt{let } u = (\lambda w.w)^{\diamond} \texttt{ in } (\texttt{let } x = u^{\circledcirc} \texttt{ in } (\texttt{let } y = x \texttt{ in } y)))$

$\xrightarrow{need,cp}$ $(\texttt{let } u = (\lambda w.w) \texttt{ in } (\texttt{let } x = (\lambda w.w)^{\diamond} \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y)))$

$\xrightarrow{need,cp}$ $(\texttt{let } u = (\lambda w.w) \texttt{ in } (\texttt{let } x = (\lambda w.w) \texttt{ in } (\texttt{let } y = (\lambda w.w) \texttt{ in } y^{\star})))$

Example

$$(\texttt{let } x = (\lambda u.u) \ (\lambda w.w) \texttt{ in } ((\lambda y.y)^{\diamond} \ x))$$

$\xrightarrow{\textit{need,lbeta}} (\texttt{let } x = ((\lambda u.u)^{\diamond} \ (\lambda w.w)) \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y))$

$\xrightarrow{\textit{need,lbeta}} (\texttt{let } x = (\texttt{let } u = \lambda w.w \texttt{ in } u)^{\diamond} \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y))$

$\xrightarrow{\textit{need,llet}} (\texttt{let } u = (\lambda w.w)^{\diamond} \texttt{ in } (\texttt{let } x = u^{\circledcirc} \texttt{ in } (\texttt{let } y = x \texttt{ in } y)))$

$\xrightarrow{\textit{need,cp}} (\texttt{let } u = (\lambda w.w) \texttt{ in } (\texttt{let } x = (\lambda w.w)^{\diamond} \texttt{ in } (\texttt{let } y = x^{\circledcirc} \texttt{ in } y)))$

$\xrightarrow{\textit{need,cp}} (\texttt{let } u = (\lambda w.w) \texttt{ in } (\texttt{let } x = (\lambda w.w) \texttt{ in } (\texttt{let } y = (\lambda w.w)^{\diamond} \texttt{ in } y^{\circledcirc})))$

Example

$$(\texttt{let } x = (\lambda u.u) \ (\lambda w.w) \text{ in } ((\lambda y.y)^{\diamond} \ x))$$

$\xrightarrow{need,lbeta} (\texttt{let } x = ((\lambda u.u)^{\diamond} \ (\lambda w.w)) \text{ in } (\texttt{let } y = x^{\circledcirc} \text{ in } y))$

$\xrightarrow{need,lbeta} (\texttt{let } x = (\texttt{let } u = \lambda w.w \text{ in } u)^{\diamond} \text{ in } (\texttt{let } y = x^{\circledcirc} \text{ in } y))$

$\xrightarrow{need,llet} (\texttt{let } u = (\lambda w.w)^{\diamond} \text{ in } (\texttt{let } x = u^{\circledcirc} \text{ in } (\texttt{let } y = x \text{ in } y)))$

$\xrightarrow{need,cp} (\texttt{let } u = (\lambda w.w) \text{ in } (\texttt{let } x = (\lambda w.w)^{\diamond} \text{ in } (\texttt{let } y = x^{\circledcirc} \text{ in } y)))$

$\xrightarrow{need,cp} (\texttt{let } u = (\lambda w.w) \text{ in } (\texttt{let } x = (\lambda w.w) \text{ in } (\texttt{let } y = (\lambda w.w)^{\diamond} \text{ in } y^{\circledcirc})))$

$\xrightarrow{need,cp} (\texttt{let } u = (\lambda w.w) \text{ in } (\texttt{let } x = (\lambda w.w) \text{ in } (\texttt{let } y = (\lambda w.w) \text{ in } (\lambda w.w))))$

Example

$$(\text{let } x = (\lambda u.u) \ (\lambda w.w) \text{ in } ((\lambda y.y)^\diamond \ x))$$

$\xrightarrow{need, lbeta} (\text{let } x = ((\lambda u.u)^\diamond \ (\lambda w.w)) \text{ in } (\text{let } y = x^\odot \text{ in } y))$

$\xrightarrow{need, lbeta} (\text{let } x = (\text{let } u = \lambda w.w \text{ in } u)^\diamond \text{ in } (\text{let } y = x^\odot \text{ in } y))$

$\xrightarrow{need, llet} (\text{let } u = (\lambda w.w)^\diamond \text{ in } (\text{let } x = u^\odot \text{ in } (\text{let } y = x \text{ in } y)))$

$\xrightarrow{need, cp} (\text{let } u = (\lambda w.w) \text{ in } (\text{let } x = (\lambda w.w)^\diamond \text{ in } (\text{let } y = x^\odot \text{ in } y)))$

$\xrightarrow{need, cp} (\text{let } u = (\lambda w.w) \text{ in } (\text{let } x = (\lambda w.w) \text{ in } (\text{let } y = (\lambda w.w)^\diamond \text{ in } y^\odot)))$

$\xrightarrow{need, cp} (\text{let } u = (\lambda w.w) \text{ in } (\text{let } x = (\lambda w.w) \text{ in } (\text{let } y = (\lambda w.w) \text{ in } (\lambda w.w))))$

- The final expression is a call-by-need FWHNF
- Call-by-need FWHNF: expression of the form $LR[\lambda x.s]$, i.e.

  ```
  let x_1 = s_1 in
    (let x_2 = s_2 in
      (...
        (let x_n = s_n in λx.s)))
  ```

Convergence

Definition

Expression s converges for call-by-need evaluation:

$$s\downarrow_{need} \iff \exists \text{ FWHNF } v : s \xrightarrow{need,*} v$$

Proposition

Let s be (let-free) expression, then $s\downarrow \iff s\downarrow_{need}$.

$\longrightarrow$ W.r.t. convergence call-by-name and call-by-need are the same

CONTEXTUAL EQUIVALENCE

Equality in the Lambda Calculus

Hochschule RheinMain

Up to now, we used three notions of equality:

- Syntactic equality

- α-equivalence

- β-convertibility $\xrightarrow{C,\beta,*}$

All of them are quite restrictive

$\longrightarrow$ We introduce a semantic equivalence, called contextual equivalence

Idea of Contextual Equivalence

Hochschule RheinMain

Leibniz' law of the identity of indiscernibles:

- if objects o_1 and o_2 have the same property for all properties, then o_1 is identical to o_2.

- equality thus means: in every context, we can exchange o_1 by o_2, but no difference is observable.

For program calculi like the lambda calculus:

Expressions s and t are equal iff

their $\underbrace{\text{behaviour}}_{\text{convergence}}$ cannot be distinguished independently in which $\underbrace{\text{context}}$ they are used.

$\forall C : C[s]$ and $C[t]$ . . .

Contextual Approximation and Equivalence

> **Definition**
>
> For the call-by-name lambda calculus:
> contextual approximation $\leq_c$ and contextual equivalence $\sim_c$ are defined as
> - $s \leq_c t$ iff $\forall C : C[s]\downarrow \implies C[t]\downarrow$
> - $s \sim_c t$ iff $s \leq_c t$ und $t \leq_c s$
>
> For the call-by-value lambda calculus:
> contextual approximation $\leq_{c,value}$ and contextual equivalence $\sim_{c,value}$ are defined as:
> - $s \leq_{c,value} t$ iff $\forall C :$ If $C[s], C[t]$ are closed and $C[s]\downarrow_{value}$, then also $C[t]\downarrow_{value}$
> - $s \sim_{c,value} t$ iff $s \leq_{c,value} t$ and $t \leq_{c,value} s$

We omit the call-by-need lambda calculus.

Closing vs. Non-Closing Contexts

- call-by-name: no difference if all, or only closing contexts are used in $\sim_c$
- call-by-value: there is a difference:
  $x \sim_{c,value} \lambda y.(x\ y)$ holds, but would not hold, if all contexts are used

	Variables represent
call-by-name	any expression
call-by-value	any value

Remark:

- the transformation $s \to \lambda x.(s\ x)$ is called eta-expansion
- the inverse transformation $\lambda x.(s\ x) \to s$ is called eta-reduction

Properties of Contextual Equivalence

Contextual equivalence is the coarsest equivalence that distinguishes obviously different expressions.

An important property is:

Proposition

- $\sim_c$ and $\sim_{c,value}$ are congruences, i.e. they are equivalence relations (i.e. reflexive, symmetric & transitive) and compatible with contexts ($s \sim t \implies C[s] \sim C[t]$).

- $\leq_c$ and $\leq_{c,value}$ are precongruences, i.e. they are preorders (i.e. reflexive & transitive) and compatible with contexts ($s \leq t \implies C[s] \leq C[t]$).

Proof: We only consider the precongruences, since the congruences follows by symmetry.

(next slide)

$\leq_c$ is a Precongruence

- reflexivity: for all contexts and expressions $C[s]\!\downarrow \implies C[s]\!\downarrow$, thus $s \leq_c s$

- transitivity: Let $r \leq_c s$ and $s \leq_c t$ and $C[r]\!\downarrow$.

  We have to show $C[t]\!\downarrow$:

  From $r \leq_c s$ we have $C[s]\!\downarrow$.

  From $s \leq_c t$ we also have $C[t]\!\downarrow$

- compatibility: Let $s \leq_c t$ and C be a context.

  We have to show $C[s] \leq_c C[t]$

  Let C' be a context such that $C'[C[s]]\!\downarrow$.

  Since $C'[C[\cdot]]$ is also a context, $s \leq_c t$ shows $C'[C[t]]\!\downarrow$

$\leq_{c,value}$ is a Precongruence

- reflexivity and compatibility: similar to $\leq_c$

- transitivity: let $r \leq_{c,value} s$ and $s \leq_{c,value} t$

  Let C be a context such that $C[r]$ and $C[t]$ are closed and $C[r]\downarrow_{value}$.

  We have to show $C[t]\downarrow_{value}$. If $C[s]$ is also closed, the reasoning is as for $\leq_c$.

  Otherwise, assume $FV(C[s]) = \{x_1, \ldots, x_n\}$.
  Let $v_1, \ldots, v_n$ be arbitrary closed values and $D = (\lambda x_1, \ldots, x_n.[\cdot]) \; v_1 \; \ldots \; v_n$.
  Since $C[r]$ and $C[t]$ are closed:

  - $D[C[r]] \xrightarrow{value,*} C[r]$ and $D[C[t]] \xrightarrow{value,*} C[t]$
  - Thus: $D[C[r]]\downarrow_{value} \iff C[r]\downarrow_{value}$ and $D[C[t]]\downarrow_{value} \iff C[t]\downarrow_{value}$

  Since $C[r]\downarrow_{value}$, we have $D[C[r]]\downarrow_{value}$.
  From $r \leq_{c,value} s$, we have $D[C[s]]\downarrow$.
  From $s \leq_{c,value} t$, we have $D[C[t]]\downarrow_{value}$ and thus also $C[t]\downarrow_{value}$. $\qquad\square$

Program Transformations

- Program transformation $s \to t$ is correct iff $s \sim_c t$ holds

- Congruence property shows that local transformations preserve "global" equivalence: if $s \sim_c t$ then $C[s] \sim_c C[t]$

- Proving correctness is usually hard, because of the universal quantification on all contexts

- Decision problems $s \overset{?}{\sim}_c t$ or $s \overset{?}{\not\sim}_c t$ are undecidable, since:
  $s \overset{?}{\not\sim}_c \Omega$ can be used to encode the halting problem
 (and since the lambda calculus is Turing complete)

# (β) is Correct in the Call-by-Name Lambda Calculus

Proposition

In the call-by-name lambda calculus: if $s \xrightarrow{\beta} t$, then $s \sim_c t$.

Proof. Let $s \xrightarrow{\beta} t$ and C be a context.

$C[t]\downarrow \implies C[s]\downarrow$:

$$
\begin{array}{ccc}
C[s] & \xrightarrow{\;C,\beta\;} & C[t] \\
{\scriptstyle name,*}\big\downarrow & & \big\downarrow{\scriptstyle name,*} \\
v' & & v
\end{array}
$$

$C[s]\downarrow \implies C[t]\downarrow$:

$$
\begin{array}{ccc}
C[s] & \xrightarrow{\;C,\beta\;} & C[t] \\
{\scriptstyle name,*}\big\downarrow & & \\
v & & \\

v, r, v' are WHNFs. $\quad\quad\quad\quad\quad$ $\cdots\cdots\rightarrow$ follows from the Standardisation-Theorem

CONTEXT LEMMA

Context Lemma: Ideas and Preparations

- In general, a context lemma states that

  it suffices to check a subset of all contexts to conclude contextual equivalence

- We only consider the case of the call-by-name lambda calculus

- We require multi-contexts: Contexts with several (or no) holes

  We write $M[\cdot_1, \ldots, \cdot_n]$ for a multi-context with n holes

  We write $M[s_1, \ldots, s_n]$ if the hole $\cdot_i$ of M is replaced by s_i (for $i = 1, \ldots, n$).

Context Lemma

Hochschule RheinMain

> **Context Lemma**
>
> Let s and t be closed expressions. If for all reductions contexts R, the implication $R[s]\downarrow \implies R[t]\downarrow$ holds, then also $s \leq_c t$ holds.

Proof. We prove the more general claim using multi-contexts:

> If for all closed expressions s_i, t_i and for $i = 1, \ldots, n$: for all reduction contexts R the implication $R[s_i]\downarrow \implies R[t_i]\downarrow$ holds, then for all multi-contexts M the implication $M[s_1, \ldots, s_n]\downarrow \implies M[t_1, \ldots, t_n]\downarrow$ holds.

The context lemma follows with $n = 1$.

Proof of the Context Lemma

> If for all closed expressions s_i, t_i and for $i = 1, \ldots, n$: for all reduction contexts R the implication $R[s_i]\downarrow \implies R[t_i]\downarrow$ holds, then for all multi-contexts M the implication $M[s_1, \ldots, s_n]\downarrow \implies M[t_1, \ldots, t_n]\downarrow$ holds.

Assume, the preconditions hold and $M[s_1, \ldots, s_n] \xrightarrow{name, m} v$ where v is a WHNF. We use induction on the following pair, ordered lexicographically;

1. The number m of call-by-name reductions from $M[s_1, \ldots, s_n]$ to a WHNF.
2. The number n of holes of M.

Base case:

- Let $n = 0$ and m arbitrary: Then M is an expression and the claim holds.

Induction step:

- Let $n > 0$, i.e. M has holes
- We split into two cases (next slide)

Proof of the Context Lemma (Cont'd)

Case: There exists a hole i, s.t. $M[s_1, \ldots, s_{i-1}, \cdot_i, s_{i+1}, \ldots, s_n]$ is a reduction context

- Then there exists a hole j, such that $M[r_1, \ldots, r_{j-1}, \cdot_j, r_{j+1}, \ldots, r_n]$ is a reduction context for any expressions $r_1, \ldots, r_n$.

- Let $M' = M[\cdot_1, \ldots, \cdot_{j-1}, s_j, \cdot_{j+1}, \ldots, \cdot_n]$

- Since $M'[s_1, \ldots, s_{j-1}, s_{j+1}, \ldots, s_n] = M[s_1, \ldots, s_n]$, they have the same call-by-name evaluation

- M' has $n-1$ holes, i.e. we can apply the IH, showing $M'[t_1, \ldots, t_{j-1}, t_{j+1}, t_n]\downarrow$.

- $C_s = M[s_1, \ldots, s_{j-1}, \cdot_j, s_{j+1}, \ldots, s_n]$ and $C_t = M[t_1, \ldots, t_{j-1}, \cdot_j, t_{j+1}, \ldots, t_n]$ are both reduction contexts, $M'[t_1, \ldots, t_{j-1}, t_{j+1}, t_n] = C_t[s_j]$ and $C_t[s_j]\downarrow$. Thus the precondition shows that $C_t[t_j]\downarrow$.

- Since $C_t[t_j] = M[t_1, \ldots, t_n]$, this shows the claim.

Proof of the Context Lemma (Cont'd)

Case $n > 0$ and no hole is a reduction context.

- If $m = 0$, then $M[s_1, \ldots, s_n]$ is a WHNF and $M[t_1, \ldots, s_n]$ must be a WHNF too.
- Otherwise, $M[s_1, \ldots, s_n] \xrightarrow{name} s' \xrightarrow{name, m-1} v$
- Inspect what can happen with the subexpressions $s_1, \ldots, s_n$ in M
- Since no hole of M is in a reduction context they can only change their position and maybe duplicated or removed.
- Since $s_1, \ldots, s_n$ are closed no other expression can be copied inside any s_i.
- Thus: There exists M' with k holes, such that
  - $s' = M'[s_{f(1)}, \ldots, s_{f(m)}]$ where $f : \{1, \ldots, m\} \to \{1, \ldots, n\}$.
  - $M[r_1, \ldots, r_n] \xrightarrow{name} M'[r_{f(1)}, \ldots, r_{f(m)}]$ for any expressions $r_1, \ldots, r_n$
  - in particular, $M[t_1, \ldots, t_n] \xrightarrow{name} M'[t_{f(1)}, \ldots, r_{t(m)}] = t'$.

  Since $s' \xrightarrow{name, m-1} v$ and the precondition holds for all pairs $s_{f(i)}, t_{f(i)}$ for $i = 1, \ldots, m$ we can apply the IH to s' and t' showing $t'\!\downarrow$ and thus also $t\!\downarrow$. $\qquad\square$

Equivalences on Open Expressions

> **Proposition 3.8.2**
>
> Let s and t be expressions with free variables $x_1, \ldots, x_n$ Then $s \leq_c t$ iff for all closed expressions $t_1, \ldots, t_n$: $s[t_1/x_1, \ldots, t_n/x_n] \leq_c t[t_1/x_1, \ldots, t_n/x_n]$

Proof.

- "$\Rightarrow$": This follows since $\leq_c$ is a precongruence and since (β) is correct.
- "$\Leftarrow$": This can be shown by the context lemma and an induction on the number of variables.

Contextual Equivalence and Call-by-Value

In the call-by-value lambda calculus:

- $(\beta_{value}) \subseteq \sim_{c,value}$ (without a proof)
- $(\beta) \nsubseteq \sim_{c,value}$, since $((\lambda x.(\lambda y.y))\ \Omega)\Uparrow_{value}$ and $\lambda y.y\downarrow_{value}$

The contextual equivalences w.r.t. call-by-name and call-by-value evaluation are not related:

$$\sim_c \nsubseteq \sim_{c,value} \quad \text{and} \quad \sim_{c,value} \nsubseteq \sim_c$$

E.g. $((\lambda x.(\lambda y.y))\ \Omega) \sim_{c,value} \Omega$ but $((\lambda x.(\lambda y.y))\ \Omega) \nsim_c \Omega$.

Least and Greatest Elements

Proposition

All closed diverging expressions are least elements w.r.t. $\leq_c$ and $\leq_{c,value}$.
For instance $\Omega \leq_c s$ and also $\Omega \leq_{c,value} s$ for all expressions s.

With $K := \lambda x.\lambda y.x$, $Y := \lambda f.(\lambda x.(f\ (x\ x)))\ (\lambda x.(f\ (x\ x)))$, and
$Z := \lambda f.(\lambda x.(f\ \lambda z.(x\ x)\ z))\ (\lambda x.(f\ \lambda z.(x\ x)\ z))$:

- $Y\ K$ is a greatest element of $\leq_c$, i.e. $\forall s : s \leq_c Y\ K$
- $Z\ K$ is a greatest element of $\leq_{c,value}$, i.e. $\forall s :\leq_c Z\ K$

eteness

We only prove the proposition for the call-by-name lambda calculus.

Least Elements w.r.t. $\leq_c$

- Let $\bot$ be a closed diverging expression and s be an arbitrary closed expression.

- Let R be an arbitrary reduction context, then $R[\bot]$ cannot converge, i.e. $R[\bot]\Uparrow$.

- The context lemma now immediately shows $\bot \leq_c s$.

- Since $\bot$ is closed, Proposition 3.8.2 shows $\bot \leq_c s$ for any (perhaps also open) expression s

Greatest Elements w.r.t. $\leq_c$

- $Y := \lambda f.(\lambda x.(f\ (x\ x)))\ (\lambda x.(f\ (x\ x)))$

- Let $r_y = (\lambda x.K\ (x\ x))$.

- Then $Y\ K \xrightarrow{C,\beta} r_y\ r_y \xrightarrow{C,\beta} K\ (r_y\ r_y)$

- $(Y\ K)\ s_1\ \dots\ s_n \xrightarrow{C,\beta,*} K\ (r_y\ r_y)\ s_1\ \dots\ s_n \xrightarrow{C,\beta,*} (r_y\ r_y)\ s_2\ \dots\ s_n \xrightarrow{C,\beta,*}$
  $(r_y\ r_y) \xrightarrow{C,\beta} K\ (r_y\ r_y) \xrightarrow{C,\beta} \lambda x.(r_y\ r_y)$

- The Standardisation-Theorem shows that for all R: $R[(Y\ K)]\!\downarrow$.

- Since $(Y\ K)$ is closed, the context lemma shows $s \leq_c (Y\ K)$ for every closed expression s

- Proposition 3.8.2 shows $s \leq_c (Y\ K)$ for any (perhaps also open) expression s.

The Z-Combinator and Call-By-Value

We explain the call-by-value evaluation of $(Z\ K)$:

- $Z = \lambda f.(\lambda x.(f\ \lambda z.(x\ x)\ z))\ (\lambda x.(f\ \lambda z.(x\ x)\ z))$

- Let $r_z = (\lambda x.(K\ \lambda z.(x\ x)\ z))$

- $Z\ K \xrightarrow{value} r_z\ r_z \xrightarrow{value} K\ \lambda z.((r_z\ r_z)\ z) \xrightarrow{value} \lambda y.\lambda z.(r_z\ r_z)\ z$

- For values $v_1, \ldots, v_n$: $(Z\ K)\ v_1\ \ldots\ v_n \xrightarrow{value,*} (r_z\ r_z)\ v_1\ \ldots\ v_n \xrightarrow{value,*}$
  $(\lambda y.\lambda z.(r_z\ r_z)\ z)\ v_1\ \ldots\ v_n \xrightarrow{value} (\lambda z.(r_z\ r_z)\ z)\ v_2\ldots\ v_n \xrightarrow{value}$
  $(r_z\ r_z)\ v_2\ v_3\ldots\ v_n \xrightarrow{value,*} (r_z\ r_z) \xrightarrow{value,*} \lambda y.\lambda z.(r_z\ r_z)\ z$

TURING COMPLETENESS OF THE LAMBDA CALCULUS

Turing Completeness

- We do not provide a formal proof
- In the lecture notes, a Haskell-implementation of Turing machines can be found
- We argue that the program constructs used in the program, can be encoded in the lambda calculus

Constructs:

- Named functions
- Recursion
- Data (booleans, numbers, pairs, lists)

Function Definitions

Non-recursive Haskell-function $f\ x_1\ \ldots\ x_n = e$ can be represented by $\lambda x_1, \ldots, x_n.e$

Recursive functions can be encoded by the fixpoint combinator:

For simplicity, let us assume, that e only calls f, but no other functions.

Function Definitions

Non-recursive Haskell-function $f\ x_1\ \ldots\ x_n = e$ can be represented by $\lambda x_1, \ldots, x_n.e$

Recursive functions can be encoded by the fixpoint combinator:

For simplicity, let us assume, that e only calls f, but no other functions.

Then f can be encoded by $Y\ (\lambda f.\lambda x_1\ \ldots\ x_n.e)$:

Function Definitions

Non-recursive Haskell-function $f\ x_1\ \ldots\ x_n = e$ can be represented by $\lambda x_1, \ldots, x_n.e$

Recursive functions can be encoded by the fixpoint combinator:

For simplicity, let us assume, that e only calls f, but no other functions.

Then f can be encoded by $Y\ (\lambda f.\lambda x_1\ \ldots\ x_n.e)$:

- Let $F = (\lambda f.\lambda x_1\ \ldots\ x_n.e)$ and $r_y = (\lambda x.F\ (x\ x))$.

Function Definitions

Non-recursive Haskell-function $f\ x_1\ \ldots\ x_n = e$ can be represented by $\lambda x_1, \ldots, x_n.e$

Recursive functions can be encoded by the fixpoint combinator:

For simplicity, let us assume, that e only calls f, but no other functions.

Then f can be encoded by $Y\ (\lambda f.\lambda x_1\ \ldots\ x_n.e)$:

- Let $F = (\lambda f.\lambda x_1\ \ldots\ x_n.e)$ and $r_y = (\lambda x.F\ (x\ x))$.
- Then $Y\ F \xrightarrow{C,\beta} r_y\ r_y = (\lambda x.F\ (x\ x))\ r_y \xrightarrow{C,\beta} F\ (r_y\ r_y) \xleftarrow{C,\beta} F\ (Y\ F)$, i.e. $Y\ F \sim_c F\ (Y\ F)$.

Function Definitions

Non-recursive Haskell-function $f\ x_1\ \ldots\ x_n = e$ can be represented by $\lambda x_1, \ldots, x_n.e$

Recursive functions can be encoded by the fixpoint combinator:

For simplicity, let us assume, that e only calls f, but no other functions.

Then f can be encoded by $Y\ (\lambda f.\lambda x_1\ \ldots\ x_n.e)$:

- Let $F = (\lambda f.\lambda x_1\ \ldots\ x_n.e)$ and $r_y = (\lambda x.F\ (x\ x))$.
- Then $Y\ F \xrightarrow{C,\beta} r_y\ r_y = (\lambda x.F\ (x\ x))\ r_y \xrightarrow{C,\beta} F\ (r_y\ r_y) \xleftarrow{C,\beta} F\ (Y\ F)$, i.e. $Y\ F \sim_c F\ (Y\ F)$.
- Thus $Y\ F \sim_c F^i\ (Y\ F)$ where F^i is the i-fold application of F and also $Y\ F \sim_c F\ (Y\ F) \sim_c \lambda x_1, \ldots, x_n.e[(Y\ F)/f]$.

Function Definitions

Hochschule RheinMain

Non-recursive Haskell-function $f\ x_1\ \ldots\ x_n = e$ can be represented by $\lambda x_1, \ldots, x_n.e$

Recursive functions can be encoded by the fixpoint combinator:

For simplicity, let us assume, that e only calls f, but no other functions.

Then f can be encoded by $Y\ (\lambda f.\lambda x_1\ \ldots\ x_n.e)$:

- Let $F = (\lambda f.\lambda x_1\ \ldots\ x_n.e)$ and $r_y = (\lambda x.F\ (x\ x))$.
- Then $Y\ F \xrightarrow{C,\beta} r_y\ r_y = (\lambda x.F\ (x\ x))\ r_y \xrightarrow{C,\beta} F\ (r_y\ r_y) \xleftarrow{C,\beta} F\ (Y\ F)$, i.e. $Y\ F \sim_c F\ (Y\ F)$.
- Thus $Y\ F \sim_c F^i\ (Y\ F)$ where F^i is the i-fold application of F and also $Y\ F \sim_c F\ (Y\ F) \sim_c \lambda x_1, \ldots, x_n.e[(Y\ F)/f]$.

For mutual recursive functions, the encoding is a bit more complicated, but still possible.

Data

- The Haskell-program uses data types and selectors

- It suffices to represent booleans, tuples, lists of arbitrary length and natural numbers to encode the program

- We sketch the so-called Church encoding of numbers, booleans, pairs and lists.

Booleans

Encoding:

$$true \quad := \lambda x.\lambda y.x$$
$$false \quad := \lambda x.\lambda y.y$$

$b\ s\ t$ for $b \in \{true, false\}$ behaves like if b then s else t.

Church Encoding of Numbers

Idea:

- Number i is represented by the i-fold function composition.
- $0 = f^0 = id$, $1 = f^1$, $2 = f^2$, $\ldots$

Encoding:

$$
\begin{aligned}
0 \quad &:= \lambda f.\lambda x.x \\
i \quad &:= \lambda f.\lambda x.f^i\ x,\ \text{if}\ i > 0
\end{aligned}
$$

Church Encoding of Numbers (Cont'd)

Addition:
$plus = \lambda m.\lambda n.\lambda f.\lambda x.m \ f \ (n \ f \ x)$

Example:

$$plus \ 3 \ 2 \quad = \quad \underbrace{(\lambda m.\lambda n.\lambda f.\lambda x.m \ f \ (n \ f \ x))}_{plus} \ \underbrace{(\lambda f.\lambda x.(f \ (f \ (f \ x))))}_{3} \ \underbrace{(\lambda f.\lambda x.(f \ (f \ x)))}_{2}$$

Church Encoding of Numbers (Cont'd)

Addition:
$plus = \lambda m.\lambda n.\lambda f.\lambda x.m \ f \ (n \ f \ x)$

Example:

$$plus \ 3 \ 2 \quad = \quad \underbrace{(\lambda m.\lambda n.\lambda f.\lambda x.m \ f \ (n \ f \ x))}_{plus} \ \underbrace{(\lambda f.\lambda x.(f \ (f \ (f \ x))))}_{3} \ \underbrace{(\lambda f.\lambda x.(f \ (f \ x)))}_{2}$$

$$\xrightarrow{C,\beta} \quad (\lambda n.\lambda f.\lambda x.(\lambda f.\lambda x.(f \ (f \ (f \ x)))) \ f \ (n \ f \ x)) \ (\lambda f.\lambda x.(f \ (f \ x)))$$

Church Encoding of Numbers (Cont'd)

Addition:
$plus = \lambda m.\lambda n.\lambda f.\lambda x.m \ f \ (n \ f \ x)$

Example:

$$plus \ 3 \ 2 \quad = \quad \underbrace{(\lambda m.\lambda n.\lambda f.\lambda x.m \ f \ (n \ f \ x))}_{plus} \ \underbrace{(\lambda f.\lambda x.(f \ (f \ (f \ x))))}_{3} \ \underbrace{(\lambda f.\lambda x.(f \ (f \ x)))}_{2}$$

$$\xrightarrow{C,\beta} \quad (\lambda n.\lambda f.\lambda x.(\lambda f.\lambda x.(f \ (f \ (f \ x)))) \ f \ (n \ f \ x)) \ (\lambda f.\lambda x.(f \ (f \ x)))$$

$$\xrightarrow{C,\beta} \quad (\lambda n.\lambda f.\lambda x.(\lambda x.(f \ (f \ (f \ x)))) \ (n \ f \ x)) \ (\lambda f.\lambda x.(f \ (f \ x)))$$

Church Encoding of Numbers (Cont'd)

Addition:
$$plus = \lambda m.\lambda n.\lambda f.\lambda x.m\ f\ (n\ f\ x)$$

Example:

$$
\begin{aligned}
plus\ 3\ 2\ =\ & \underbrace{(\lambda m.\lambda n.\lambda f.\lambda x.m\ f\ (n\ f\ x))}_{plus}\ \underbrace{(\lambda f.\lambda x.(f\ (f\ (f\ x))))}_{3}\ \underbrace{(\lambda f.\lambda x.(f\ (f\ x)))}_{2} \\
\xrightarrow{C,\beta}\ & (\lambda n.\lambda f.\lambda x.(\lambda f.\lambda x.(f\ (f\ (f\ x))))\ f\ (n\ f\ x))\ (\lambda f.\lambda x.(f\ (f\ x))) \\
\xrightarrow{C,\beta}\ & (\lambda n.\lambda f.\lambda x.(\lambda x.(f\ (f\ (f\ x))))\ (n\ f\ x))\ (\lambda f.\lambda x.(f\ (f\ x))) \\
\xrightarrow{C,\beta}\ & (\lambda n.\lambda f.\lambda x.(f\ (f\ (f\ (n\ f\ x)))))\ (\lambda f.\lambda x.(f\ (f\ x)))
\end{aligned}
$$

Church Encoding of Numbers (Cont'd)

Addition:
$plus = \lambda m.\lambda n.\lambda f.\lambda x.m\ f\ (n\ f\ x)$

Example:

$$plus\ 3\ 2\ =\ \underbrace{(\lambda m.\lambda n.\lambda f.\lambda x.m\ f\ (n\ f\ x))}_{plus}\ \underbrace{(\lambda f.\lambda x.(f\ (f\ (f\ x))))}_{3}\ \underbrace{(\lambda f.\lambda x.(f\ (f\ x)))}_{2}$$

$\xrightarrow{C,\beta}\quad (\lambda n.\lambda f.\lambda x.(\lambda f.\lambda x.(f\ (f\ (f\ x))))\ f\ (n\ f\ x))\ (\lambda f.\lambda x.(f\ (f\ x)))$

$\xrightarrow{C,\beta}\quad (\lambda n.\lambda f.\lambda x.(\lambda x.(f\ (f\ (f\ x))))\ (n\ f\ x))\ (\lambda f.\lambda x.(f\ (f\ x)))$

$\xrightarrow{C,\beta}\quad (\lambda n.\lambda f.\lambda x.(f\ (f\ (f\ (n\ f\ x)))))\ (\lambda f.\lambda x.(f\ (f\ x)))$

$\xrightarrow{C,\beta}\quad \lambda f.\lambda x.(f\ (f\ (f\ ((\lambda f.\lambda x.(f\ (f\ x)))\ f\ x)))))$

Church Encoding of Numbers (Cont'd)

Addition:
$plus = \lambda m.\lambda n.\lambda f.\lambda x.m \; f \; (n \; f \; x)$

Example:

$$
\begin{aligned}
plus \; 3 \; 2 \quad = \quad & \underbrace{(\lambda m.\lambda n.\lambda f.\lambda x.m \; f \; (n \; f \; x))}_{plus} \; \underbrace{(\lambda f.\lambda x.(f \; (f \; (f \; x))))}_{3} \; \underbrace{(\lambda f.\lambda x.(f \; (f \; x)))}_{2} \\
\xrightarrow{C,\beta} \quad & (\lambda n.\lambda f.\lambda x.(\lambda f.\lambda x.(f \; (f \; (f \; x)))) \; f \; (n \; f \; x)) \; (\lambda f.\lambda x.(f \; (f \; x))) \\
\xrightarrow{C,\beta} \quad & (\lambda n.\lambda f.\lambda x.(\lambda x.(f \; (f \; (f \; x)))) \; (n \; f \; x)) \; (\lambda f.\lambda x.(f \; (f \; x))) \\
\xrightarrow{C,\beta} \quad & (\lambda n.\lambda f.\lambda x.(f \; (f \; (f \; (n \; f \; x))))) \; (\lambda f.\lambda x.(f \; (f \; x))) \\
\xrightarrow{C,\beta} \quad & \lambda f.\lambda x.(f \; (f \; (f \; ((\lambda f.\lambda x.(f \; (f \; x))) \; f \; x))))) \\
\xrightarrow{C,\beta,2} \quad & \lambda f.\lambda x.(f \; (f \; (f \; (f \; (f \; x))))) = 5
\end{aligned}
$$

Church Encoding of Numbers (Cont'd)

Successor:
$succ = \lambda n.\lambda f.\lambda x.f \ (n \ f \ x).$

Predecessor (complicated and $pred \ 0 = 0$):
$pred = \lambda n.\lambda f.\lambda x.n \ (\lambda g.\lambda h.h \ (g \ f)) \ (\lambda z.x) \ (\lambda u.u)$

Pairs

Encoding:
$pair := \lambda x.\lambda y.\lambda z.z \ x \ y$

The first two arguments are the arguments of the pair, the third one is for the selector.

Examples:
$$first \quad = \lambda p.p \ K$$
$$second \quad = \lambda p.p \ K2$$

Note that $first \ (pair \ s \ t) \sim_c s$ and $second \ (pair \ s \ t) \sim_c t$.

Lists

Non-empty lists can be encoded by pairs p:

- the first component of p is the element
- the second component of p is the tail of the list

Lists

Non-empty lists can be encoded by pairs p:

- the first component of p is the element
- the second component of p is the tail of the list

With the empty list: additional pair $pair\ flag\ p$ where $flag$ is $true$ or $false$ and

- $pair\ true\ s$ means the empty list (independent of s)
- $(false, p)$ is a non-empty list.

Encoding:

$$nil \quad := pair\ true\ true$$
$$cons \quad := \lambda h.\lambda t.pair\ false\ (pair\ h\ t)$$

Lists

Non-empty lists can be encoded by pairs p:

- the first component of p is the element
- the second component of p is the tail of the list

With the empty list: additional pair $pair\ flag\ p$ where $flag$ is $true$ or $false$ and

- $pair\ true\ s$ means the empty list (independent of s)
- $(false, p)$ is a non-empty list.

Encoding:

$nil\quad := pair\ true\ true$

$cons\quad := \lambda h.\lambda t.pair\ false\ (pair\ h\ t)$

Examples:

$isNil\quad = first$

$head\quad = \lambda l.first\ (second\ l)$

$tail\quad = \lambda l.second\ (second\ l)$

Remarks

Hochschule RheinMain

- Church encoding does not distinguish between data and functions
- Also different data is encoded in the same way (e.g. 0 and $false$)

Types?

- Haskell only allows well-typed programs

- the lambda calculus has no types

- This is not a restriction for Turing completeness, since the typed encoding can also be used as an untyped one

This concludes our sketch on Turing completeness

Discussion

- the lambda calculus is too small to really program in it
- also for a core language it is too difficult to express data and recursion
- equivalences in the lambda calculus do not necessarily hold in Haskell, since different data is mapped to the same lambda expressions
- Haskell has `seq`, the lambda calculus cannot simulate this
- In the next chapter: We extend the lambda calculus to a real core language of functional programming
